- Hémorragie
- Jarvik
- Impella
- MCS et CHD
- Destination therapy
- Qualité de vie
- Conclusions

Classification

Table 1 Approved Temporary and Durable Devices Eligible for Entry Into PediMACS

PediMACS devices	
Durable	Temporary
AbioCor TAH, Abiomed, Inc.	Abiomed AB5000, Abiomed, Inc.
MicroMed Debakey VAD-Child, Micromed Technology, Inc.	Abiomed BVS 5000, Abiomed, Inc.
SynCardia, Syncardia Systems, Inc.	Impella 2.5, Abiomed, Inc.
HeartMate II LVAS, Thoratec Corporation	Impella 5.0, Abiomed, Inc.
HeartMate IP, Thoratec Corporation	Impella CF, Abiomed, Inc.
HeartMate VE, Thoratec Corporation	Tandem Heart, CardiacAssist, Inc.
HeartMate XVE, Thoratec Corporation	Thoratec CentriMag, Thoratec Corporation, Inc.
Thoratec IVAD, Thoratec Corporation	Thoratec PediMag, Thoratec Corporation, Inc.
Thoratec PVAD, Thoratec Corporation	Biomedicus, Medtronic Biomedicus, Inc.
HeartWare HVAD, HeartWare, Inc.	Jostra Rotaflow, Maquet Cardiovasuclar
NovaCor PC, HeartWare, Inc.	Revolution, Sorin Group
NovaCor PCq, HeartWare, Inc.	
Berlin Heart EXCOR Pediatric, Berlin Heart, Inc.	

Classification

Table 2 Pedimacs Devices and Classifications

Device Class	Device Brand
Paracorporeal Pulsatile	AbioMed AB5000, Berlin Heart EXCOR, Thoratec PVAD
Paracorporeal Continuous	Thoratec Centrimag, Thoratec Pedimag, Maquet Rotaflow, Sorin Revolution
Implantable Continuous	HeartWare HVAD, HeartMate II LVAS
Percutaneous	Abiomed Impella 2.5/5.0, Tandem Heart, Abiomed Impella CP
Total Artificial Heart	Syncardia Total Artificial Heart

Classification

Description of device

- Extracorporeal	Pump for device located outside of the body	ECMO, CPB, EXCOR
- Intracorporeal	Pump for device located with the body	HeartMate 3, HVAD, Jarvik
- Temporary	Device intended for limited duration of support (hours-days; 3 weeks ?)	Impella 2.5, Impella CP, ECMO
- Durable	Device with capability of support for months-years	HeartMate 3, HVAD, Jarvik
- Partial Support	Device provides less flow than complete cardiac output	Impella 2.5-5.0-CP
- Full Support	Device provides complete cardiac output	ECMO, EXCOR, INCOR, HeartMate 3, HVAD
- Dischargeable	Device does not require hospitalization for continued support	HeartMate 3, HVAD

Classification

Type of Flow

- Pulsatile	Device with flexible membranes that creates intermittent flow and a pulse	Total artificial heart, EXCOR
- Non pulsatile/ Continous flow	Device that provides constant blood flow	HeartMate 3, HVAD, Pedimag, RotaFlow, Jarvik
- Axial	Device with inlet and outflow in the same axis and flow produced by rotating impeller	HeartMate 3, Jarvik
- Centrifugal	Device with inlet perpendicular to outflow tracts. Flow produced by centrifugal force.	HeartMate 2, HVAD, RotaFlow

Classification

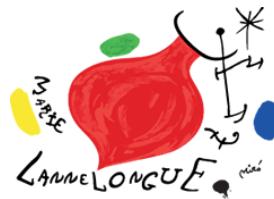

Indication for MCS use

- Bridge to transplant	Device implanted to support patient until a heart transplant	HeartMate II, HVAD
- Bridge to candidacy	Device implanted to support patient until can determine whether eligible for a heart transplant	HeartMate II, HVAD
- Bridge to recovery	Device implanted until myocardial recovery from injury	HeartMate II, HVAD
- Destination therapy	Device implanted to support patients who are ineligible for heart transplant	HeartMate II, HVAD, Jarvik
- Short term	New term to describe device implanted with intention for weeks-months of support (replaces bridge to transplant or recovery)	ECMO, Impella, Tandem, EXCOR
- Long term	New term to describe device implanted with the intention for years of support (replaces destination therapy)	HeartMate II, HVAD, Jarvik(?)

Long term MCS in CHD

Device	Manufacturer	Type of flow	Flows	Suggested BSA (m ²)	Reference
Berlin Heart EXCOR®	Berlin Heart GmbH, Berlin, Germany	Pulsatile	10, 15, 25, 30, 50, and 60 mL (SV)	>0.7	Morales et. al (2011) Fraser et. al (2012) Almond, et al (2013) Weinstein et. al (2014) Conway, et al (2015) Morales, et al (2017)
HeartWare HVAD ®	Heart-Ware, Framingham, MA, USA	Continuous	2–10 L/min	> 1	Miera et. al (2011) Padalino et. al (2014) Sparks et al (2015) Stein et. al (2016) Miera et. al (2016) Imielskii et. al (2017) Pac, et al (2018)
HeartMate II	Thoratec, Pleasanton, CA, USA	Continuous	0.5–10 L/min	>1.2	Owens et. al (2010) Morales et.al (2011) Cabrera et. al (2013) Lorts, et. al (2018)
HeartMate III	Thoratec, Pleasanton, CA, USA	Continuous	2.5–10 L/min	>1.2	
Total artificial Heart	Syncardia, Tucson, AZ, USA	Pulsatile	50cc and 70 cc (stroke volume)	> 1.7	Morales et. al (2012) Rossano et. al (2014) Adachi et. al (2014) Si et. al (2015) Ryan et. al (2015) Villa et. al (2017) Morales et. al (2017)
Jarvik 2000	Jarvik Heart, Inc., New York, NY, USA	Continuous	3–7 L/min	>1.2	Shah et. al, (2013)
Inf Jarvik 2015	Jarvik Heart, Inc., New York, NY, USA	Continuous	>1.2L/min	>0.4	Adachi, (2018) ⁹

Physiopathologie insuffisance cardiaque

Insuffisance cardiaque : cercle vicieux

Dysfonction Ventriculaire

Baisse de la fonction pompe

Mise en jeu de
mécanismes inadaptés

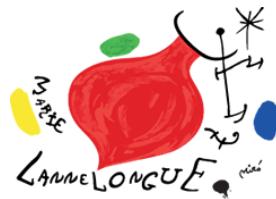

Altération
physiopathologique

Stimulation neuro-hormonale excessive
Charge sodique et calcique
Stress oxydatif
Apoptose

Diminution de la PA
Hypo perfusion tissulaire
Pressions auriculaires

Tentative d'adaptation physiologique

Régulation de la PA
Régulation de la volémie
Stimulation sympathique
Baro réflexe
Hormones natriurétiques

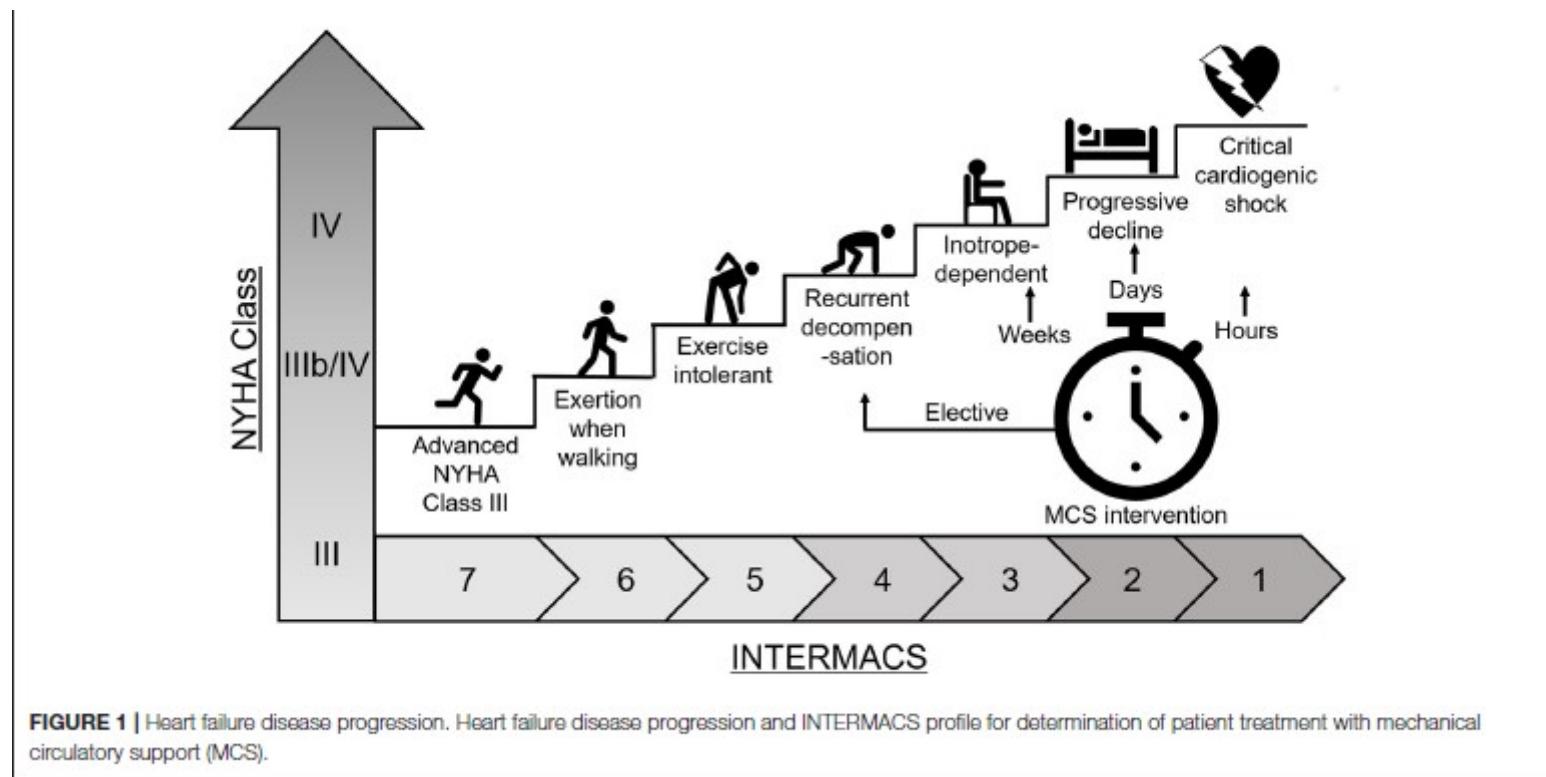

INTERMACS

Interagency Registry for Mechanically Assisted Circulatory Support

PEDIMACS

Pediatric Interagency Registry for Mechanically Assisted Circulatory Support

PEDI MACS

Outcomes of children implanted with ventricular assist devices in the United States: First analysis of the Pediatric Interagency Registry for Mechanical Circulatory Support (PediMACS)

J Heart Lung Transplant. 2016 May;35(5):578-84

Elizabeth D. Blume, MD,^a David N. Rosenthal, MD,^b Joseph W. Rossano, MD,^c
J. Timothy Baldwin, PhD,^d Pirooz Eghtesady, MD, PhD,^e
David L.S. Morales, MD,^f Ryan S. Cantor, MSPH,^{g,h} Jennifer Conway, MD,ⁱ
Angela Lorts, MD,^f Christopher S. Almond, MD, MPH,^b David C. Naftel, PhD,^j
James K. Kirklin, MD^j and for the PediMACS Investigators

- **1er registre Pédiatrique (Basé sur INTERMACS)**
- **< 19 ans, tous types de VAD, > 200 pt, 222 devices**
- **Multicentrique, rétrospective**
- **Sept 2012 - Juin 2015, 37 hôpitaux USA, statistique simple plutôt descriptive**

PEDIMACS

- **Classification** : durable – temporary
- **Profile des patients au moment de l'implantation du VAD** : âge, poids, diagnostique, CHD, previous cardiac surgery, INTERMACS, ≠ pulsatile devices **vs** continuous implantables, previous ECMO
- **Device strategy** : LVAD, BiVAD, RVAD, TAH ; indications et suite (Transplantation, bridge to recovery, destination therapy)
- **Survival** : à 6 mois, différences selon profile INTERMACS
- **Causes/modes of death** : 19% ; MOF 39%, Neuro complic 14% ; 18% stop traitement
- **Competing outcomes** : greffe - survie on VAD - décès on VAD
- **Evénements indésirables** : 502 ; infections (Tardives), saignement/hémorragie (Précoces), problèmes sur le VAD, neuro ++

PEDIMACS

Objectifs du PediMACS

- Définir la **meilleur stratégie** de support pour enfants et ados
- Peaufiner la **sélection** des patients < 19 ans à soumettre à implantation de VAD
- Développer «**les bonnes pratiques**» par analyse des résultats
- Favoriser et guider **développement** et **surveillance clinique** des **différentes type** de VAD Ped et Adulte utilisés sur patientes < 19 ans

Second annual Pediatric Interagency Registry for Mechanical Circulatory Support (Pedimacs) report: Pre-implant characteristics and outcomes

Elizabeth D. Blume, MD,^a Christina VanderPluym, MD,^a Angela Lorts, MD,^b
J. Timothy Baldwin, PhD,^c Joseph W. Rossano, MD,^d David L.S. Morales, MD,^b
Ryan S. Cantor, MSPH,^e Marissa A. Miller, DVM, MPH,^c James D. St. Louis, MD,^f
Devin Koehl, BS,^e David L. Sutcliffe, MD,^g Pirooz Eghtesady, MD, PhD,^h
James K. Kirklin, MD,^e and David N. Rosenthal, MDⁱ for the Pedimacs
Investigators The Journal of Heart and Lung Transplantation, Vol 37, No 1, January 2018

- Focus on caractéristiques pre-implantation.
Outcomes et événements indésirables
- < 19 ans, 364 pt, 432 devices
- > 4 ans (Sept 2012-Sept 2016), 42 centres USA

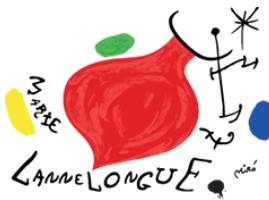

Table 1 Preimplant Characteristics of Pedimacs Patients (n=364)

Characteristic	Mean \pm SD or No. (%)
Age, year	9.3 \pm 6.5
Age group	
< 1 year	69 (19.0)
1–6 years	66 (18.1)
6–10 years	56 (15.4)
11–19 years	173 (47.5)
Weight, kg	40.6 \pm 33.0
Weight	
< 5 kg	34 (9.4)
5–20 Kg	102 (28.1)
21–40 kg	68 (18.7)
41–70 kg	91 (25.1)
71–100 kg	49 (13.5)
> 100 kg	19 (5.2)
Diagnosis	
Cardiomyopathy	223 (61.3)
Myocarditis	41 (11.3)
Congenital heart disease	77 (21.2)
Other	23 (6.3)
Non-white race	149 (40.9)
No previous cardiac operation	209 (57.4)
Heart failure before admission	206 (56.6)
AST > 100 U/liter	79 (22.6)
ALT > 100 U/liter	83 (23.6)
Creatininine > 1.6 mg/dl	17 (4.7)
Intubated	149 (49)
Inotropes	339 (93)
Paralyzed	69 (23)
TPN dependent	106 (35)

ALT, alanine aminotransferase; AST, aspartate aminotransferase; Pedimacs, Pediatric Interagency Registry for Mechanical Circulatory Support; SD, standard deviation; TPN, total parenteral nutrition. The status of Intubated, Paralyzed, and TPN dependent were added to Pedimacs in protocol v4 and were available for 302 patients.

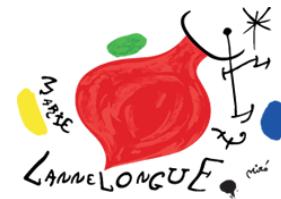

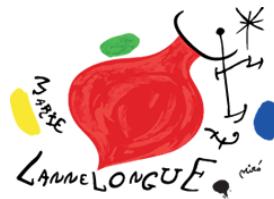

Table 4 Pre-Implant Patient Profile by Device Classification

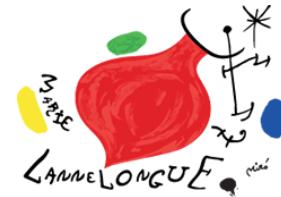

Pre-implant patient profile ^a	Paracorporeal pulsatile No. (%)	Paracorporeal continuous No. (%)	Implantable continuous No. (%)
1: Critical cardiogenic shock	40 (38)	30 (51)	28 (16)
2: Progressive decline	56 (54)	25 (42)	110 (64)
3: Stable but inotrope dependent	6 (6)	4 (7)	26 (15)
4–7: Resting symptoms or less sick	2 (2)	...	8 (5)

^aThe pre-implant patient profile was missing for 6 patients.

PEDIMACS ≠ INTERMACS

- Les données sur les résultats ont été analysées par patient plutôt que par type d'appareil : certains patients pédiatriques prise en charge sur plusieurs types d'appareils (temporaires et durables) pendant toute la prise en charge
- *Echange d'appareils PAS une complication liée à l'appareil* (Comme dysfonctionnement ou thrombose pompe, typique des adultes). VADs pédiatrique : échange de dispositif lié à facteurs spécifiques du patient, associés aux changements dans les besoins physiologiques et hémodynamiques,
- PAS le reflet de l'efficacité du dispositif, mais plutôt la complexité en constante évolution des patients pédiatriques VAD
- Les résultats et les événements indésirables de Pedimacs : analyse de ces événements tout au long du parcours du patient assisté par le VAD, quel que soit le besoin d'une nouvelle pompe

Third Annual Pediatric Interagency Registry for Mechanical Circulatory Support (Pedimacs) Report: Preimplant Characteristics and Outcomes

Ann Thorac Surg
2019;107:993–1004

David L. S. Morales, MD, Joseph W. Rossano, MD, Christina VanderPluym, MD,
Angela Lorts, MD, Ryan Cantor, PhD, James D. St. Louis, MD, Devin Koeh, BS,
David L. Sutcliffe, MD, Iki Adachi, MD, James K. Kirklin, MD, David N. Rosenthal, MD,
and Elizabeth D. Blume, MD, for the Pedimacs Investigators

- < 19 ans, **423 pt, 508 devices**, > 5 ans (Sept 2012-Sept 2016), 30 centres USA (Problèmes avec STS 1 Aout 2018 → >750 devices et > 600 patients PEDIMACS)
- **Statistique plus complexe** (Multivariate analysis)
- Pedimacs ≠ Intermacs
- Abordés les discours de la **sortie à la maison** (IC) et la **qualité de vie**
- Fc rénale eGFR et not

Focus on résultats globaux + facteurs associés au risque de décès précoce, tardif et constant influencé par type de pompe et les différences correspondantes entre les cohortes des appareils, compris les données démographiques de leurs patients et les taux des événements indésirables

Table 2 Patient Characteristics Before Implant of a Durable Device

Baseline characteristics	All (n = 200)	Pulsatile flow (n = 91)	Continuous flow (n = 109)	p-value ^a
Age (y)	11 (0.03–18)	2 (0.03–17)	15 (0.64–18)	<0.0001
Age (y)				<0.0001
< 1 year	31 (15.5)	30 (33.0)	1 (0.9)	
1 to 5 years	37 (18.5)	34 (37.4)	3 (2.8)	
6 to 10 years	31 (15.5)	14 (15.4)	17 (15.6)	
> 10 years	101 (50.5)	13 (14.3)	88 (80.7)	
Weight (kg)	36 (3–141)	11.4 (3.0–135.0)	62.4 (15.5–141.0)	<0.0001
Weight (kg)				<0.0001
5 to 20 kg	59 (29.5)	55 (60.4)	4 (3.7)	
< 5 kg	11 (5.5)	11 (12.1)		
> 20 kg	130 (65.0)	25 (27.5)	105 (96.3)	
Female	78 (39.0)	42 (46.2)	36 (33.0)	0.0581
Cardiac diagnosis				0.0083
Cardiomyopathy	146 (73.0)	56 (61.5)	90 (82.6)	
Myocarditis	17 (8.5)	10 (11.0)	7 (6.4)	
Congenital heart disease	35 (17.5)	24 (26.4)	11 (10.1)	
Other	2 (1.0)	1 (1.1)	1 (0.9)	
Patient profile				0.0139
1. Critical cardiogenic shock	52 (27.1)	32 (36.8)	20 (19.0)	
2. Progressive decline	107 (55.7)	43 (49.4)	64 (61.0)	
3. Stable, but inotrope-dependent	25 (13.02)	7 (8.0)	18 (17.1)	
4. Resting symptoms or less sick	8 (4.2)	5 (5.7)	3 (2.9)	
Non-white race	80 (40.0)	35 (38.5)	45 (41.3)	0.6849
Previous cardiac operation	76 (38.0)	50 (54.9)	26 (23.9)	<0.0001
Previous ECMO	30 (15.0)	22 (24.2)	8 (7.3)	0.0009

Continuous variables are expressed as median (minimum–maximum). Categorical variables are expressed as number (%). ECMO, extracorporeal membrane oxygenation.

^aComparison of pulsatile- vs continuous-flow devices.

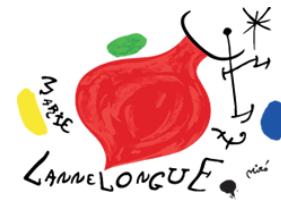

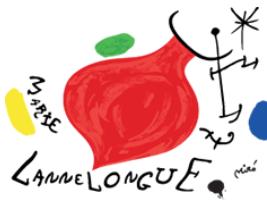

Table 1 Preimplant Characteristics of Pedimacs Patients (n=364)

Characteristic	Mean ± SD or No. (%)
Age, year	9.3 ± 6.5
Age group	
< 1 year	69 (19.0)
1–6 years	66 (18.1)
6–10 years	56 (15.4)
11–19 years	173 (47.5)
Weight, kg	40.6 ± 33.0
Weight	
< 5 kg	34 (9.4)
5–20 Kg	102 (28.1)
21–40 kg	68 (18.7)
41–70 kg	91 (25.1)
71–100 kg	49 (13.5)
> 100 kg	19 (5.2)
Diagnosis	
Cardiomyopathy	223 (61.3)
Myocarditis	41 (11.3)
Congenital heart disease	77 (21.2)
Other	23 (6.3)
Non-white race	149 (40.9)
No previous cardiac operation	209 (57.4)
Heart failure before admission	206 (56.6)
AST > 100 U/liter	79 (22.6)
ALT > 100 U/liter	83 (23.6)
Creatinine > 1.6 mg/dl	17 (4.7)
Intubated	149 (49)
Inotropes	339 (93)
Paralyzed	69 (23)
TPN dependent	106 (35)

ALT, alanine aminotransferase; AST, aspartate aminotransferase; Pedimacs, Pediatric Interagency Registry for Mechanical Circulatory Support; SD, standard deviation; TPN, total parenteral nutrition. The status of Intubated, Paralyzed, and TPN dependent were added to Pedimacs in protocol v4 and were available for 302 patients.

INCLUSION CRITERIA FOR MCS

1. NYHA IV (Ross IV pts 6 ans), insuffisance cardiaque réfractaire traitement médical, avec 1 des critères suivant :

- a) INTERMACS 1 ou 1A: choc cardiogénique
- b) INTERMACS 2 OU 2A : risque décès non immédiat moins < réponse inotropes ; dégradation à cause TDR + 1 des critères suivant :
 - * *dégradation fc rénale*
 - * *dégradation état nutritionnel*
 - * *dégradation mobilité, déambulation secondaire à insuffisance cardiaque ou ses traitement (IOT → Bed rest)*
- c) ECMO ou Short-Term MCS
- d) Pose CEC IMPOSSIBLE(CHD ; inscription liste greffe)

INCLUSION CRITERIA FOR MCS

- 2. Inscription en liste**
- 3. Circulation BiV, cardiomiopathie, CHD reparé
(ALCAPA; Sténose Ao), cardiopathie acquise
(Myocardite, Kawasaki)**
- 4. Age 0-16 ANS ; âge gestationnel corrigé > 37 SA**
- 5. Poids \geq 3 kgs et \leq 60 kgs**
- 6. Tutelle parentale/légale (Et patient si âge appropriée), comprend la procédure et la prise en charge à long-terme, signature consentement écrit avant implantation**

EXCLUSION CRITERIA FOR MCS

1. CIV apicale ou autres lésions à réparer
2. TIH, pathologies plaquettes ou contrindications AC/AG
3. Pathologie coagulation (Déficit FVIII, CIVD) ou thrombofilie (Mutation FV Leiden)
4. Maladies hématologiques → fragilité GR ou hémolyse
5. Infection récente (</=48H) avec Hémoc +/T > 38°C/↑ CRP/ Leucocytoses > 15x10³/ml)
6. HIV, SIDA, Cancer
7. AVC < 30 jours, malformation SNC associée risque saignement (MAV, Moya-Moya)
8. Maladies psychiatriques, altérations du comportement (Antisociaux) avec risque de pas adhérer au traitement
9. Autre protocole investigation-Drug Trial non complétés ou follow-up non terminé

Table 1. Characteristics of Pediatric Interagency Registry for Mechanical Circulatory Support Patients—Coverage: September 19, 2012, to December 31, 2017

Characteristics ^a	Overall (n = 423)	Paracorporeal Pulsatile (n = 121)	Paracorporeal Continuous (n = 79)	Implantable Continuous (n = 197)	p Value ^b	CHD Patients (n = 86)

	Late	1	0.07	2	0.1					2	0.05	

^a Early: within 3 months after implant; late: beyond 3 months after implant. ^b Rates are reported per patient-year.

^c Device incidence indicates overall percentage of patients within the device group experiencing the specified event.

CVA = cerebrovascular accident.

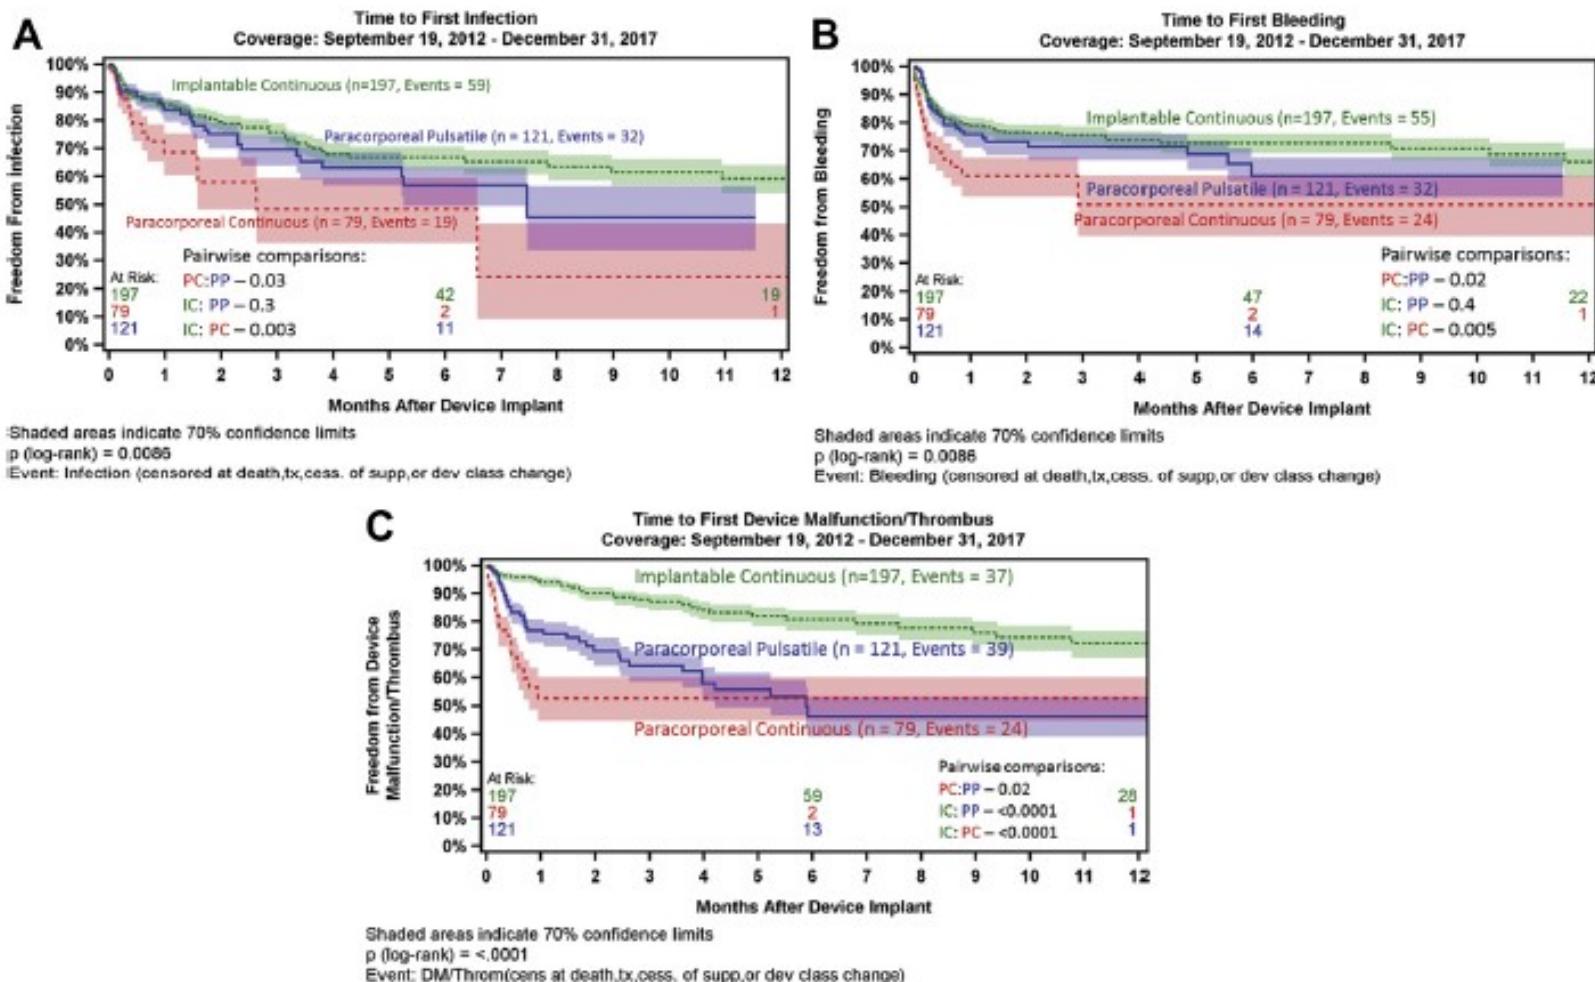

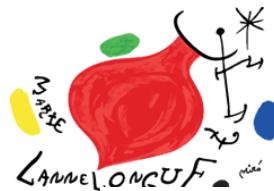

Fig 4. Kaplan-Meier depiction of freedom from (A) first infection, (B) major bleeding, and (C) device malfunction (DM) or thrombosis, stratified by device type. The shaded areas indicate the 70% confidence limit. (IC = implantable continuous; PC = paracorporeal continuous; PP = paracorporeal pulsatile.)

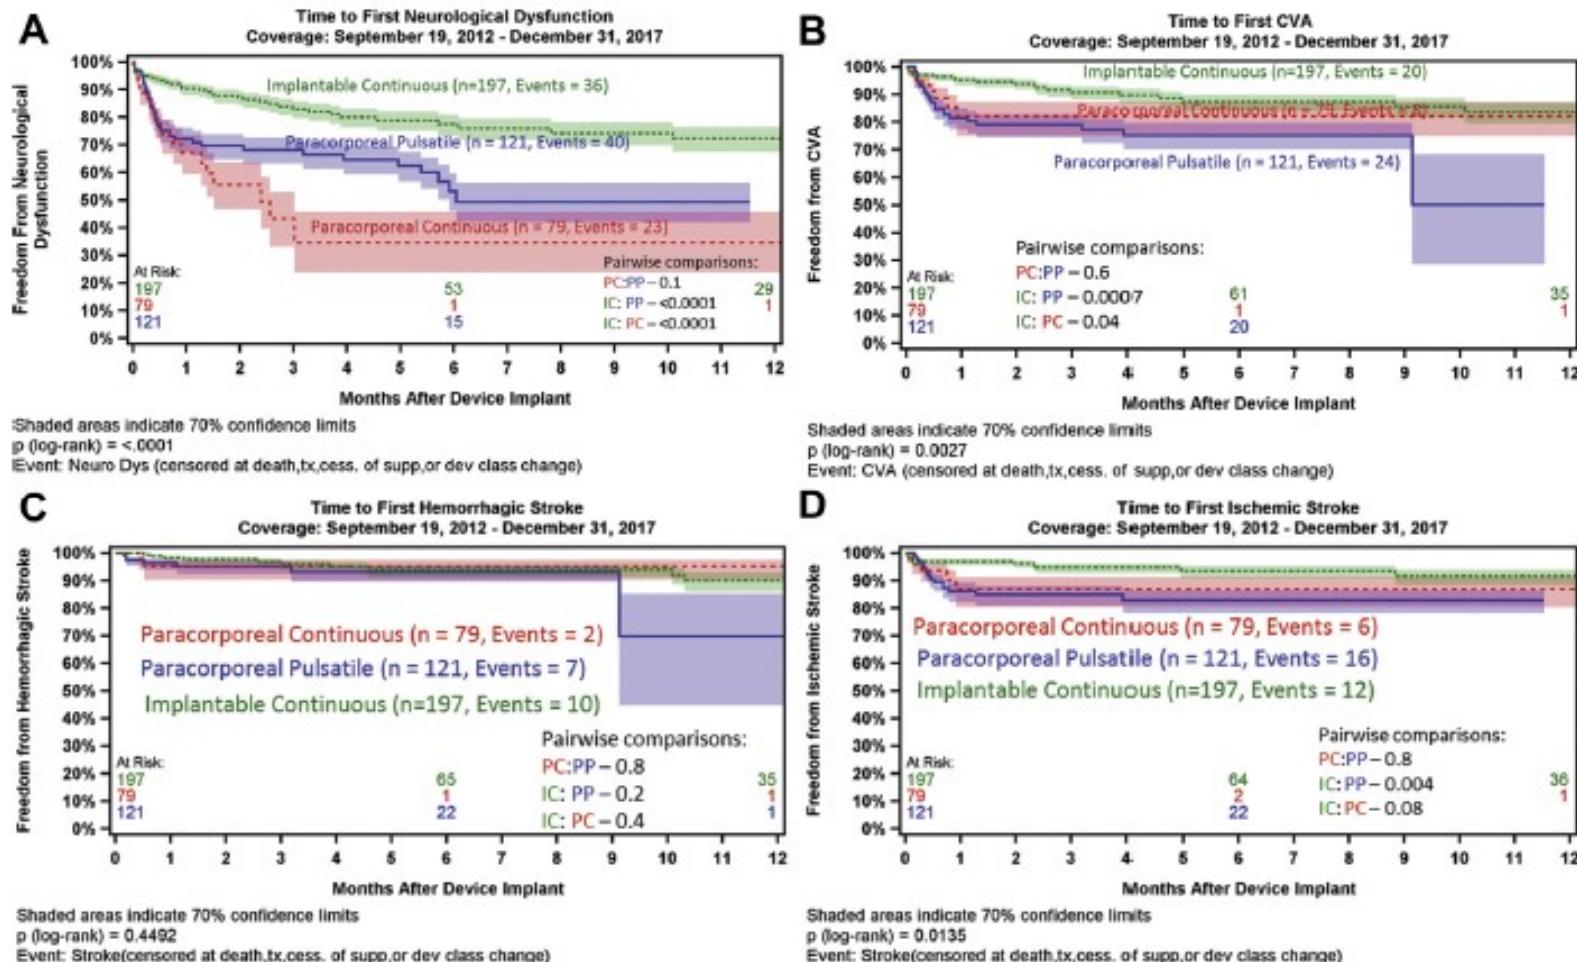

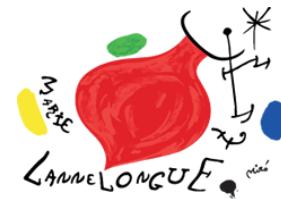

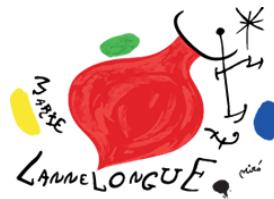

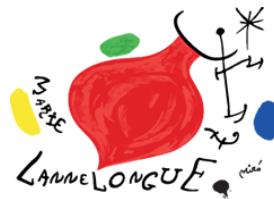

Fig 5. Kaplan-Meier depiction of freedom from (A) first neurologic event, (B) cerebrovascular accident (CVA), (C) hemorrhagic stroke, and (D) ischemic stroke, stratified by device (dev) type. The shaded areas indicate the 70% confidence limit. (cess. of supp = cessation of support; IC = implantable continuous; PC = paracorporeal continuous; PP = paracorporeal pulsatile; tx = transplantation.)

Mortalité et outcomes

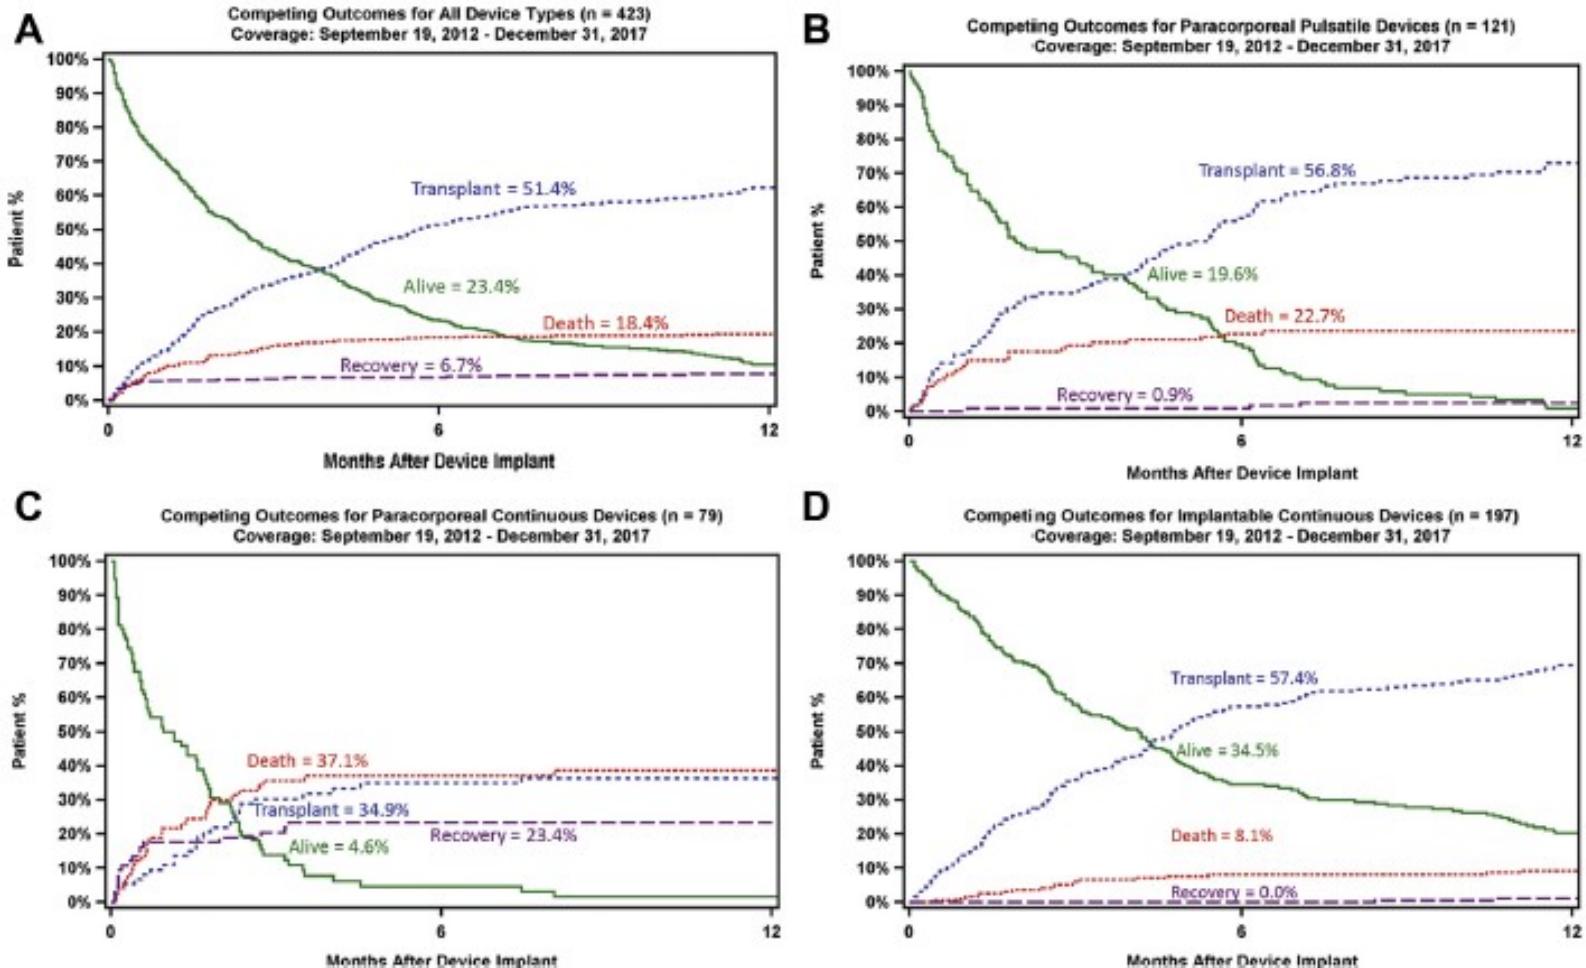

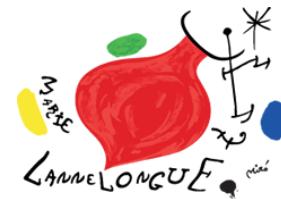

Fig 3. Competing outcomes depiction for patients receiving (A) any device type, (B) paracorporeal pulsatile-flow devices, (C) paracorporeal continuous-flow devices, or (D) implantable continuous-flow devices. At any time point, the sum of the proportions for the various outcome events (all mutually exclusive) equals 100%.

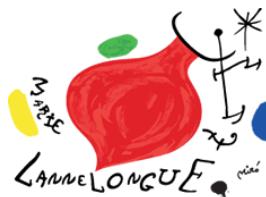

Table 6. Parametric Hazard Modeling Overall, Pediatric Interagency Registry for Mechanical Circulatory Support Patients ($n = 423$)—Coverage: September 19, 2012, to December 31, 2017

Risk Factors for Death	Early Hazard		Constant Hazard	
	HR (95% CI)	p Value	HR (95% CI)	p Value
BiVAD	3.6 (1.8–7.3)	0.0004		
Patient profile 1	2.6 (1.4–5.0)	0.003		
Paracorporeal continuous device	4.1 (2.0–8.4)	0.0001		
Percutaneous device	13.5 (4.4–41.2)	<0.0001		
Small-volume center (<15 patients)	3.3 (1.8–6.4)	0.0002		
Severe right ventricular ejection fraction	0.4 (0.2–0.7)	0.002		
Weight (kg)	0.9 (0.9–1.0)	0.001		
Age squared (years)	1.01 (1.0–1.02)	0.02		
Functional capacity–intubated			4.3 (1.5–12.8)	0.008
Bilirubin (mg/dL)			1.1 (1.0–1.1)	0.02

BiVAD = biventricular assist device; CI = confidence interval; HR = hazard ratio.

Table 7. Parametric Hazard Modeling for Paracorporeal Pulsatile Devices, Pediatric Interagency Registry for Mechanical Circulatory Support Patients ($n = 121$)—Coverage: September 19, 2012, to December 31, 2017

Risk Factors for Death	Early Hazard	
	HR (95% CI)	p Value
Dialysis	23.2 (7.6–70.4)	<0.0001
Era September 2012 to 2014	2.6 (1.1–5.9)	0.03
Small-volume center (<15 patients)	4.4 (2.1–9.4)	0.0001
Natural log of age (years)	0.7 (0.5–0.8)	0.0005

CI = confidence interval; HR = hazard ratio.

Table 8. Parametric Hazard Modeling for Paracorporeal Continuous Devices, Pediatric Interagency Registry for Mechanical Circulatory Support Patients ($n = 79$)—Coverage: September 19, 2012, to December 31, 2017

Risk Factors for Death	Early Hazard	
	HR (95% CI)	p Value
Blood Type O	4.0 (1.2–13.3)	0.03
History of valve operation	8.5 (1.9–38.8)	0.006
Severe RVEF	2.8 (1.2–6.5)	0.01
AST (U/L)	1.0 (1.0–1.0)	0.001

AST = aspartate aminotransferase; CI = confidence interval; HR = hazard ratio; RVEF = right ventricular ejection fraction.

- Outcomes dépendent de **facteurs démographiques** et **gravité maladie pré-implantation**
- **Facteurs associés à mortalité** : percutanée, BiVAD , centres avec moins de volume (< 15 VADs/année)
- **IC-VAD** : **ECMO** pré-implantation
- **PP-VAD** : gravité maladie (Dialyse), inexpérience → avant 2014, < 15 patients/center, petite âge
- **PC-VAD** : gravité maladie(IH, dysfonction VD sévère), chirurgie valvulaire, groupe O (Difficile à greffer)

PAEDIATRIC OPERATIVE TECHNIQUES

- Introduction: PEDIMACS EUROMACS CF-VAD discharge home
- Small children – system selection: CHD, Berlin Heart EXCOR ; CF-VAD $> 1.2 \text{ m}^2$; CF vs P VAD → stroke, device failure
- Single ventricle – Fontan haemodynamics: case reports, small case series, high mortality ; VAD in Glenn challenge ++ ; FONTAN circulation failure 1) Systemic ventricular failure 2) Failure at level of the CPC ; BiVAD in Fontan after revision of the Fontan pathway
- TAH: Transplant or DT ; 70-cc TAH adulte (Approved) – 50-cc TAH complex pediatric cases ; high mortality
- Special cases: VAD in CHD with SV ; surgically Corrected TGA (Senning, Mustard) or Corrected Congenital TGA → possible, challenge +++, dedicated heart team discussion ; adult CHD and NON adult CHD = survival

Primary cause of death	n (%)
Neurological dysfunction	26 (38.2)
Multiorgan failure	13 (19.1)
Major bleeding	4 (5.9)
Major infection	4 (5.9)
Cardiopulmonary failure	3 (4.4)
Device malfunction	2 (2.9)
Right heart failure	1 (1.5)
Other	7 (10.3)
Unknown/missing	8 (11.8)
Total	68

- Median support time 4.2 months (0–83.6 months). Median ICU LOS 22 days (0–422 days)
- 265 (80%) children survived 2-year follow-up
- 6m 33.2% 12m 46.7% 57.5% 2Y transplanted post VAD implantation
- 68 patients died (38.2% died of cerebrovascular accidents, 19.1% MOF)

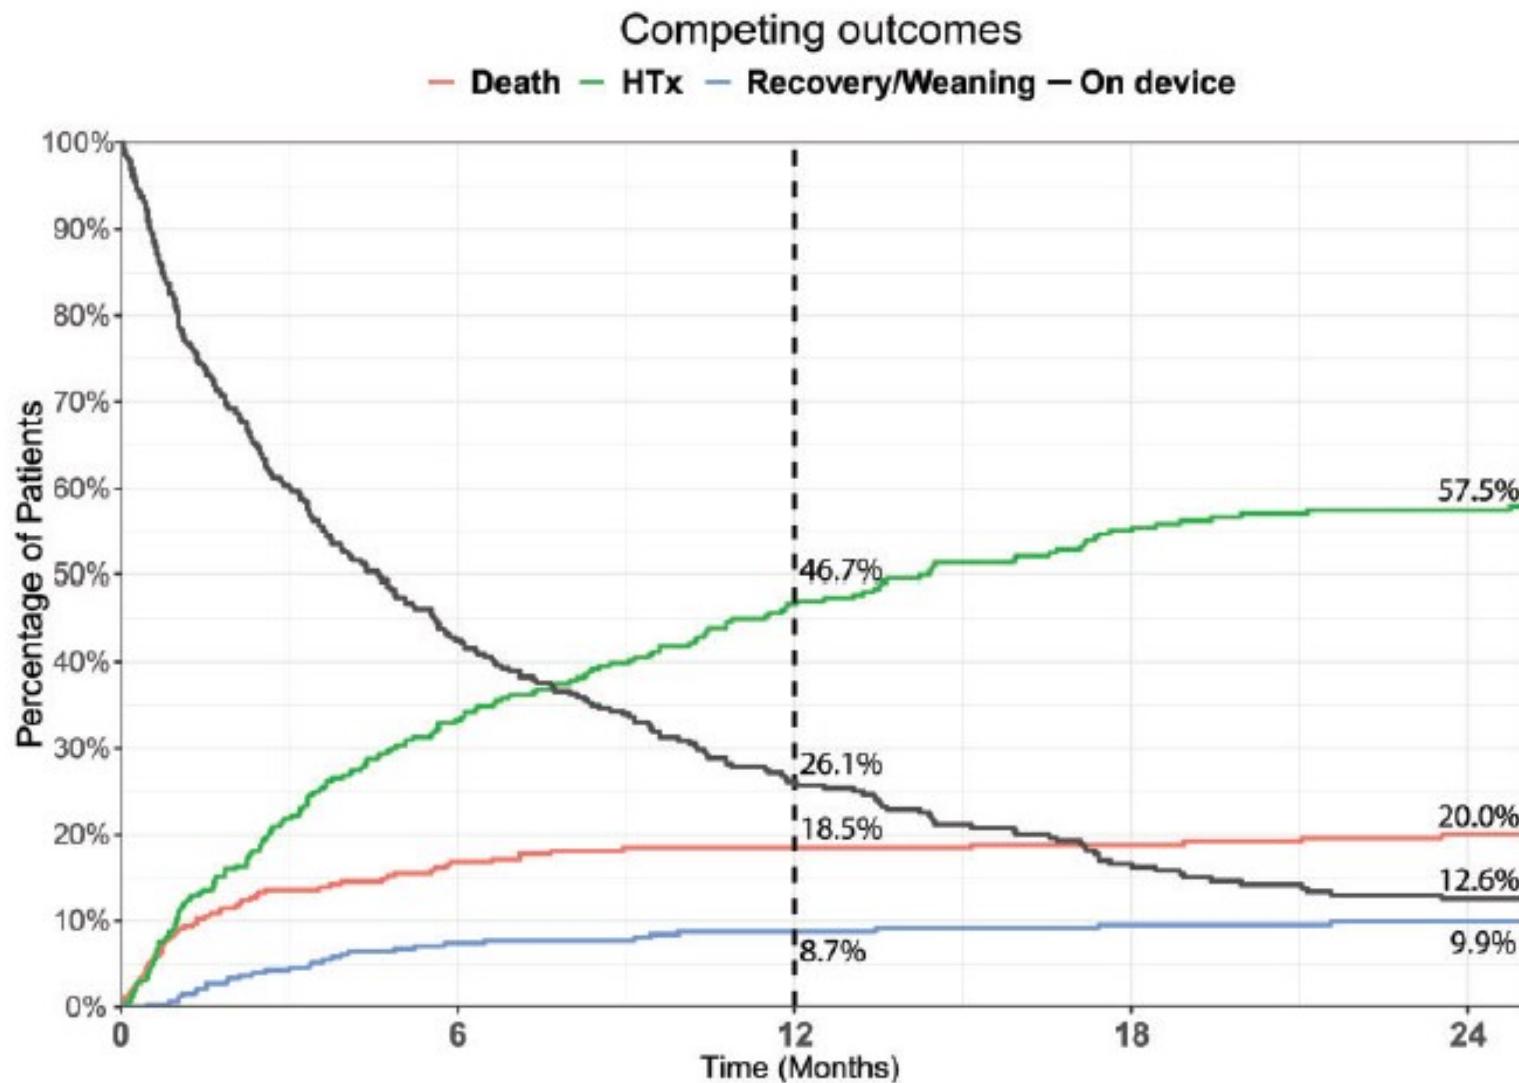

Figure 2: Competing outcomes analysis for death, heart transplant, recovery/weaning or patients on device support. HTx: heart transplant

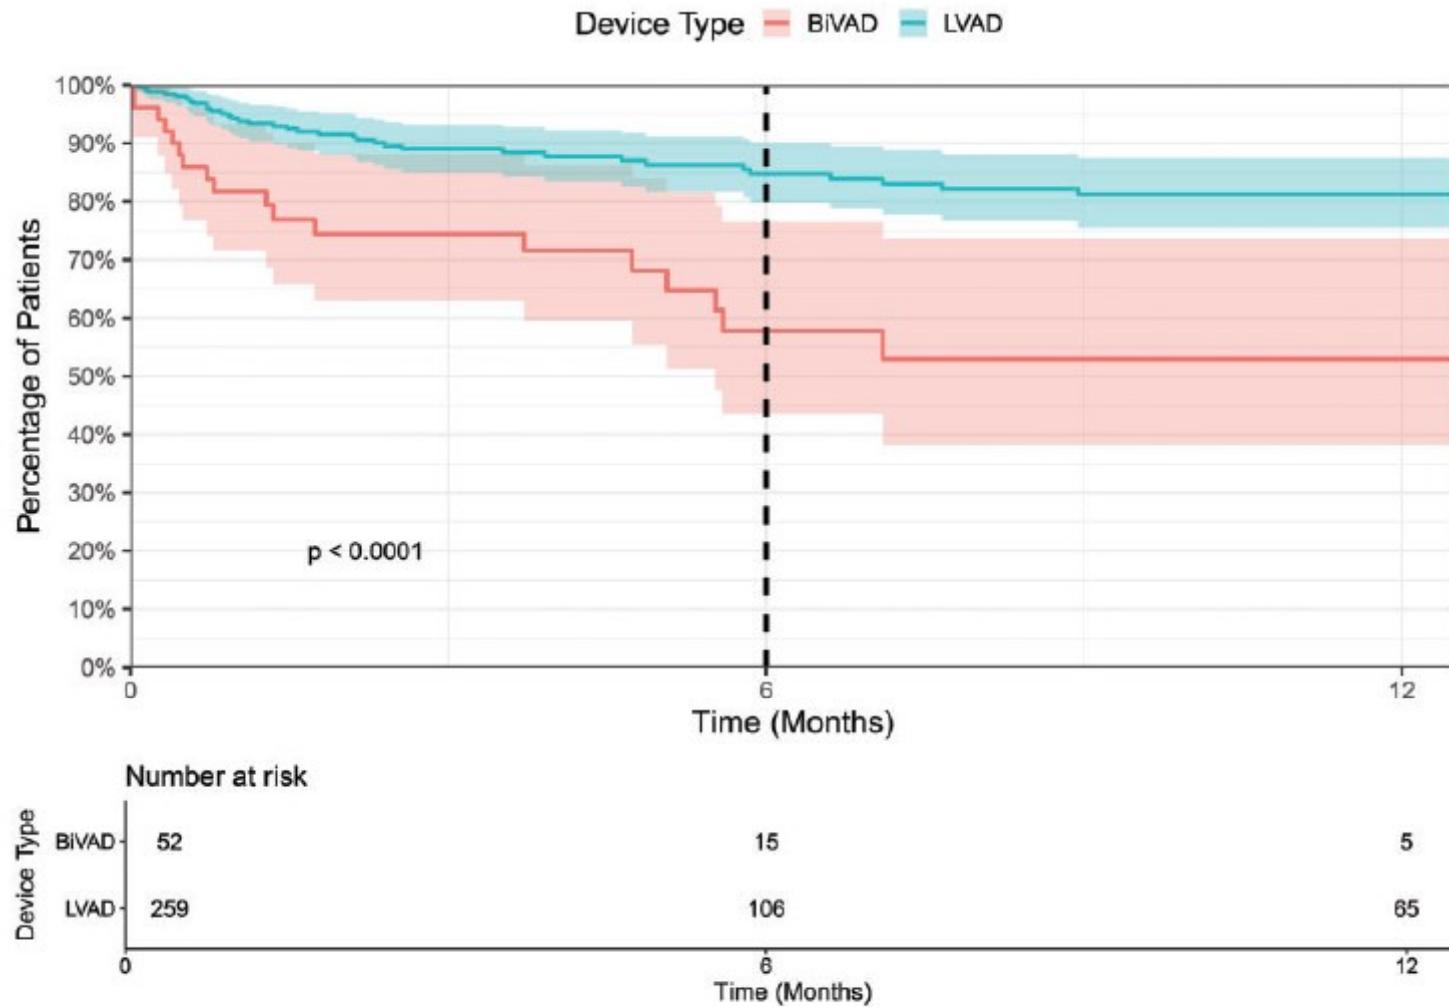

Figure 3: Survival analysis of LVAD versus BiVAD. BiVAD: biventricular assist device; LVAD: left ventricular assist device.

- Survival all patients with MCS 79.9% 6m 75.5% 12m 67.9% 2 years
- Stratified for device type Survival 1 year 81.3% for LVADs 52.9% for BiVADs

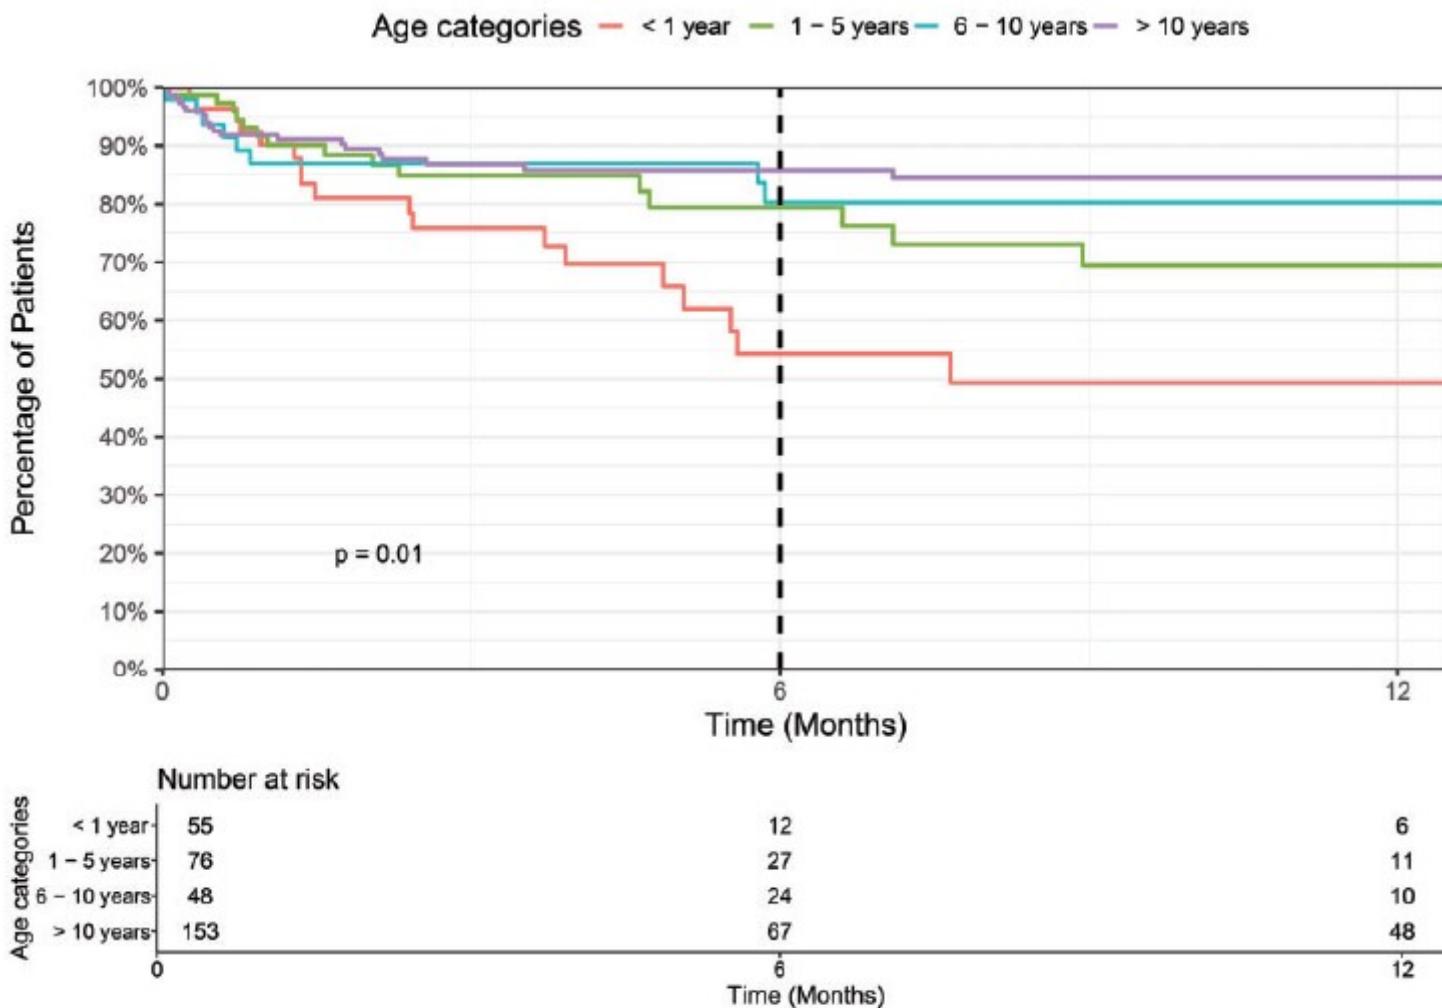

Figure 4: Survival analysis by age category.

Stratified by age, 11–19Y survival rate 1Y 84.5% 2Y 78.4% 6–10Y survival rate 1Y 80.3% 1–5Y survival rate 1Y 69.4% <1 year old poorest survival rate of 49.3% at 1 year ($P = 0.01$)

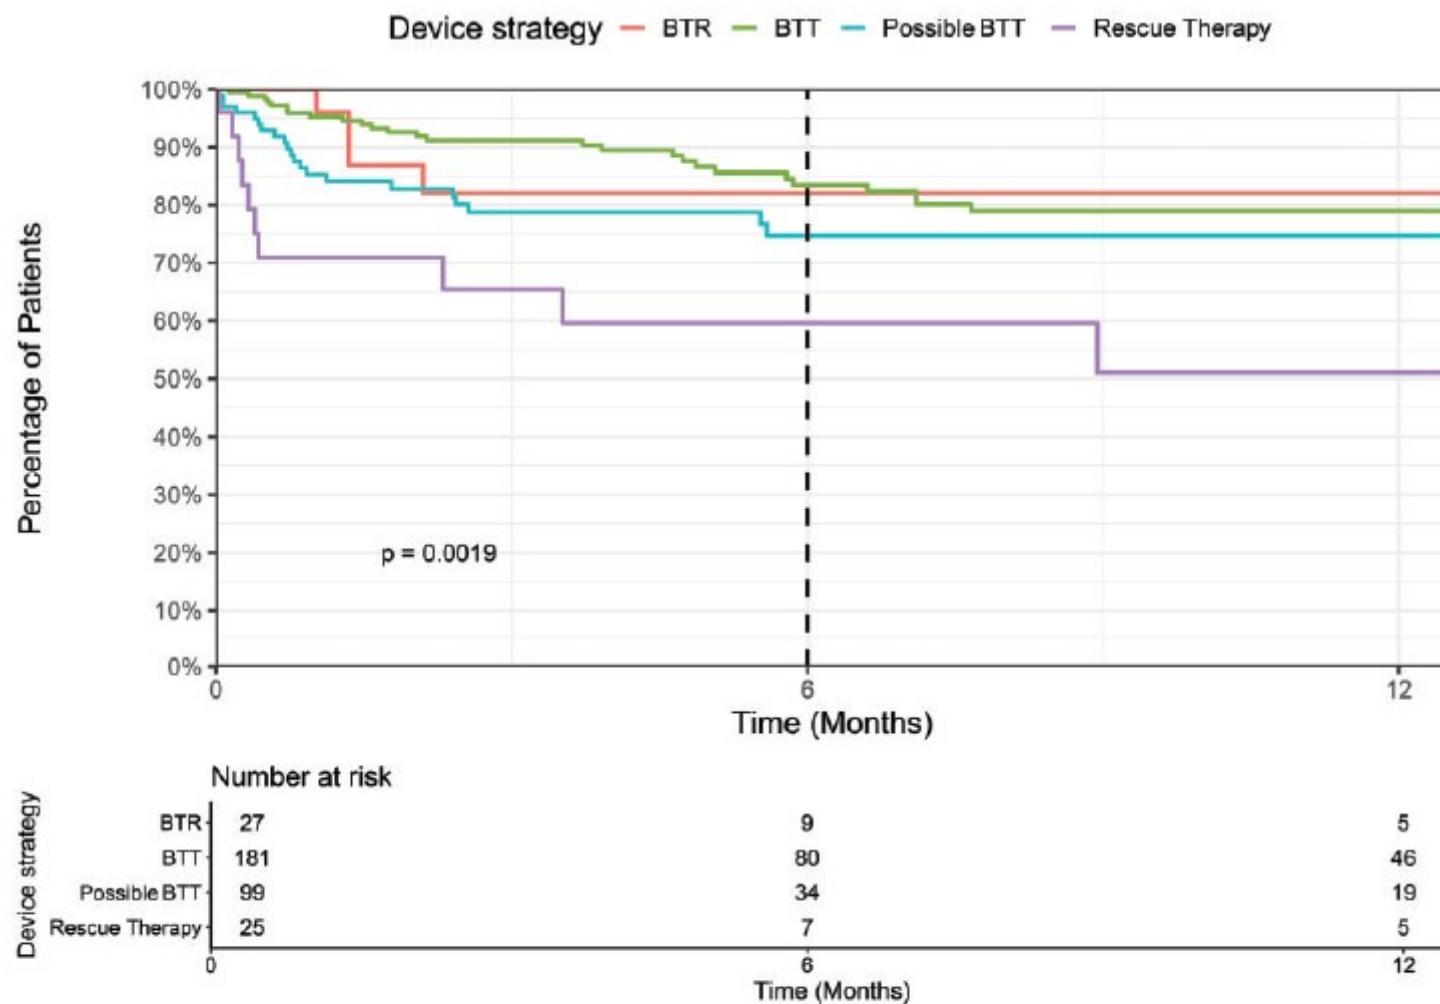

Figure 5: Survival analysis by device strategy. BTR: bridge to recovery; BTT: bridge to transplant.

1-year survival rate stratified by device strategy survival rates 82% bridge to recovery, 78.9% for bridge to transplant, 74.7% for possible bridge to transplant worst survival rate (51%) for rescue therapy (P = 0.0019)

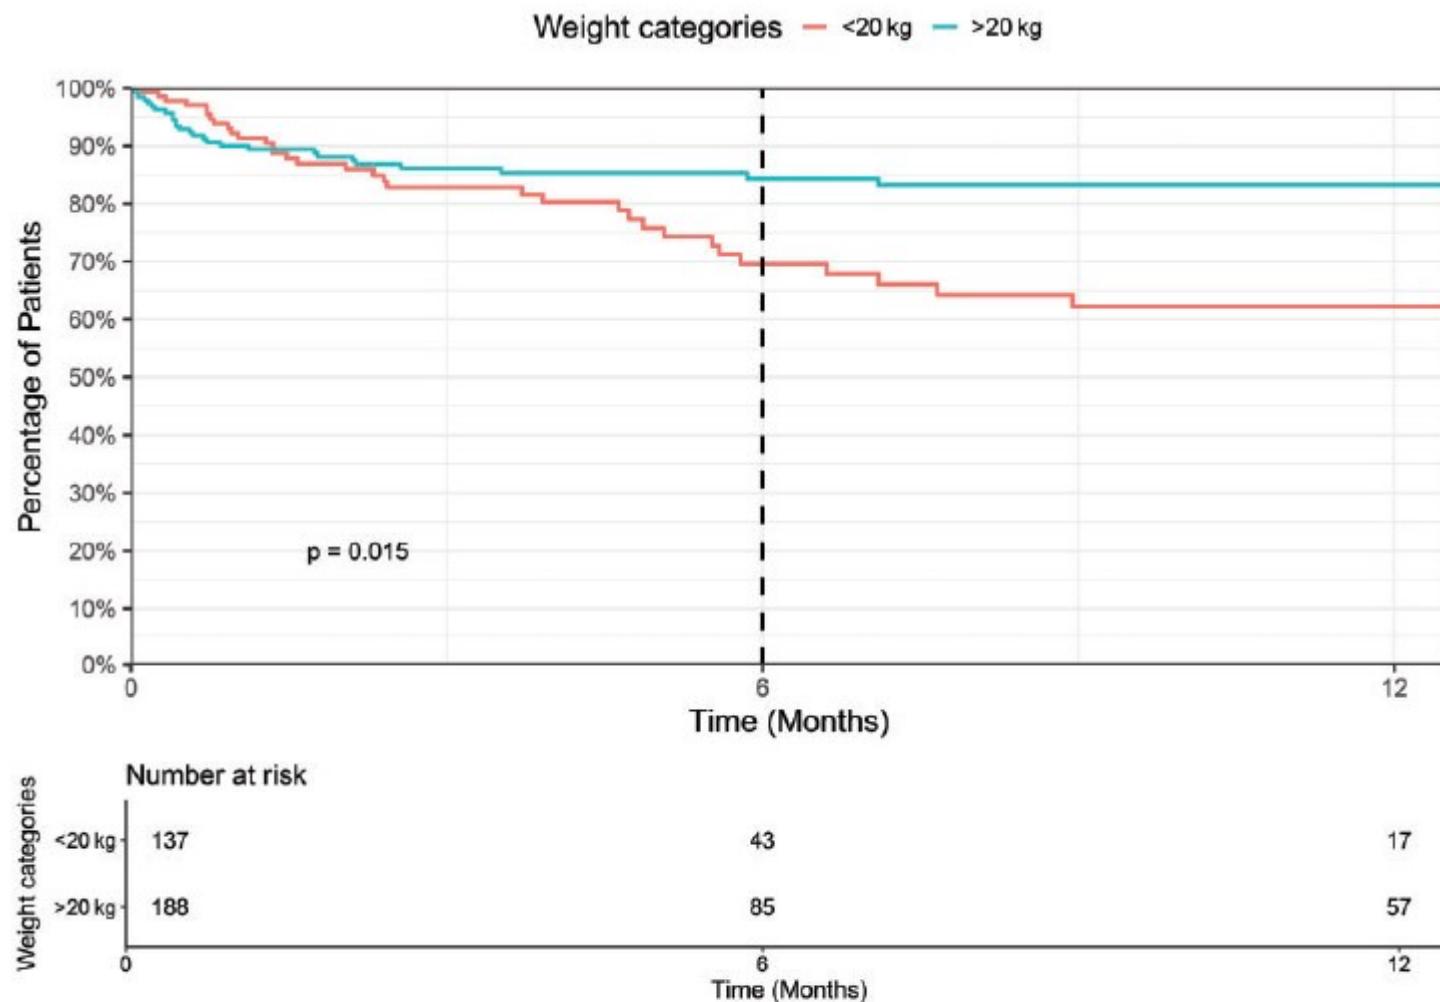

Figure 6: Survival by weight below 20 kg or 20 kg and above.

Significantly worse survival rate for patients weighing $<20\text{ kg}$ ($P = 0.015$)

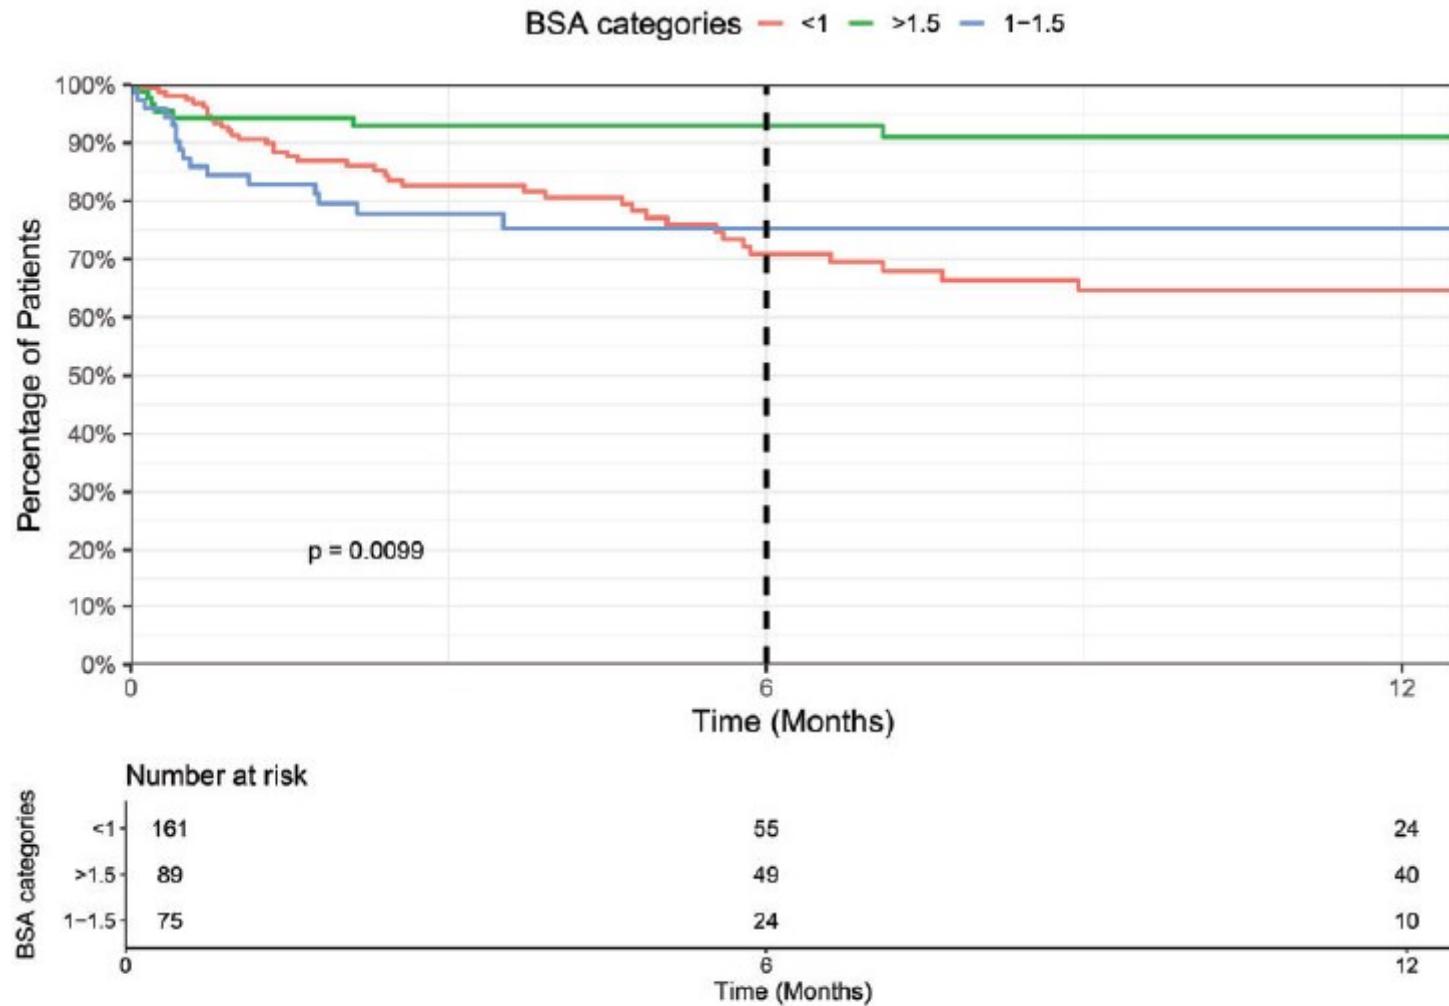

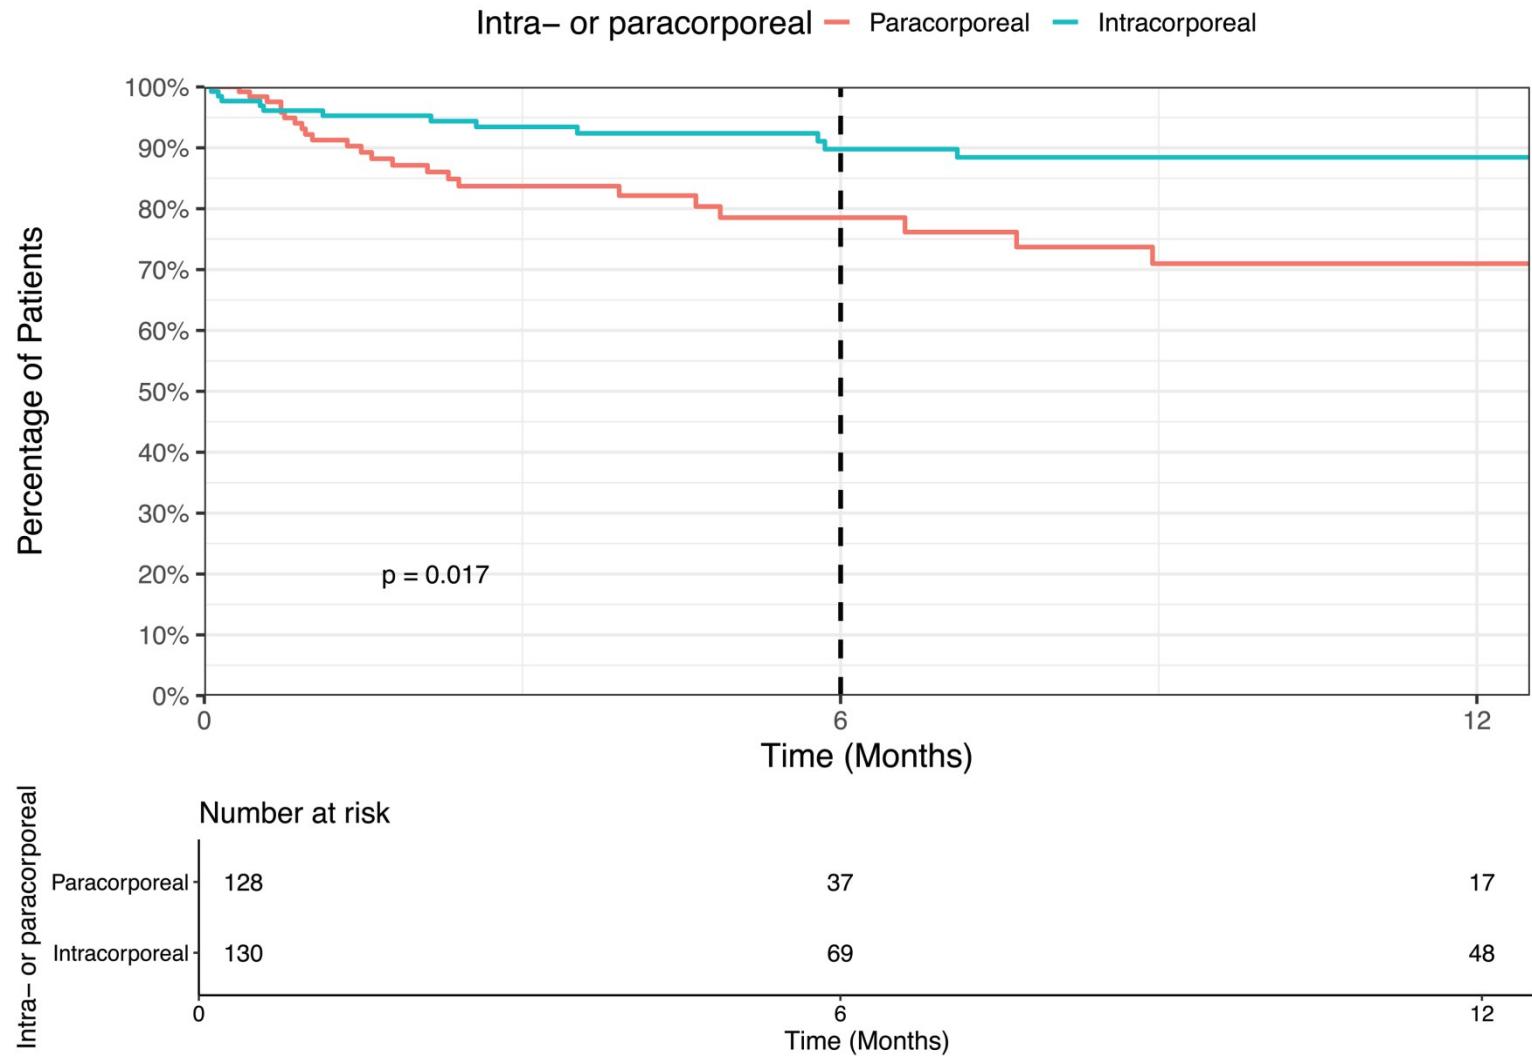

Figure 7: Survival stratified by BSA. BSA: body surface area.

Patients lower BSA (<1m² or between 1 and 1.5m²) worse survival rate than patients with a BSA >/= 1.5m² (P = 0.0099)

Supplementary Figure 3: Survival by intra- or paracorporeal device type.

P-VAD compared to CF-VAD device significantly worse survival for paracorporeal support (71% vs 88%; P = 0.017)

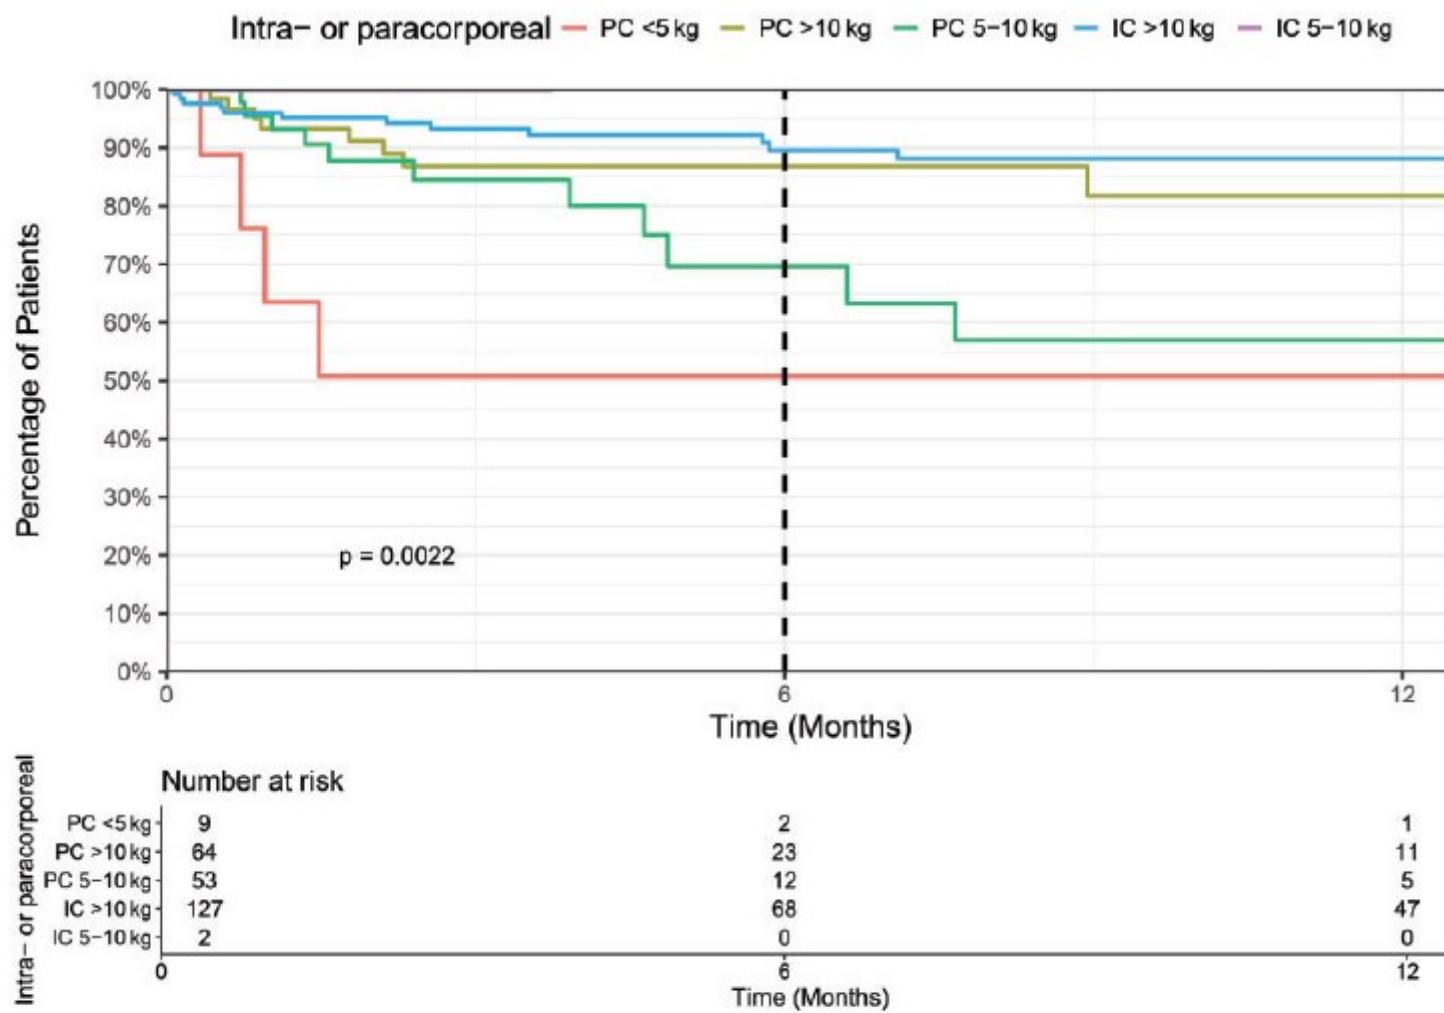

Figure 8: Survival for IC versus PC devices by weight category. IC: intracorporeal; PC: paracorporeal.

Groups intracorporeal and paracorporeal devices separated by weight categories, >10 kg do not have a significantly different outcome but do differ significantly between weight categories ($P = 0.0022$)

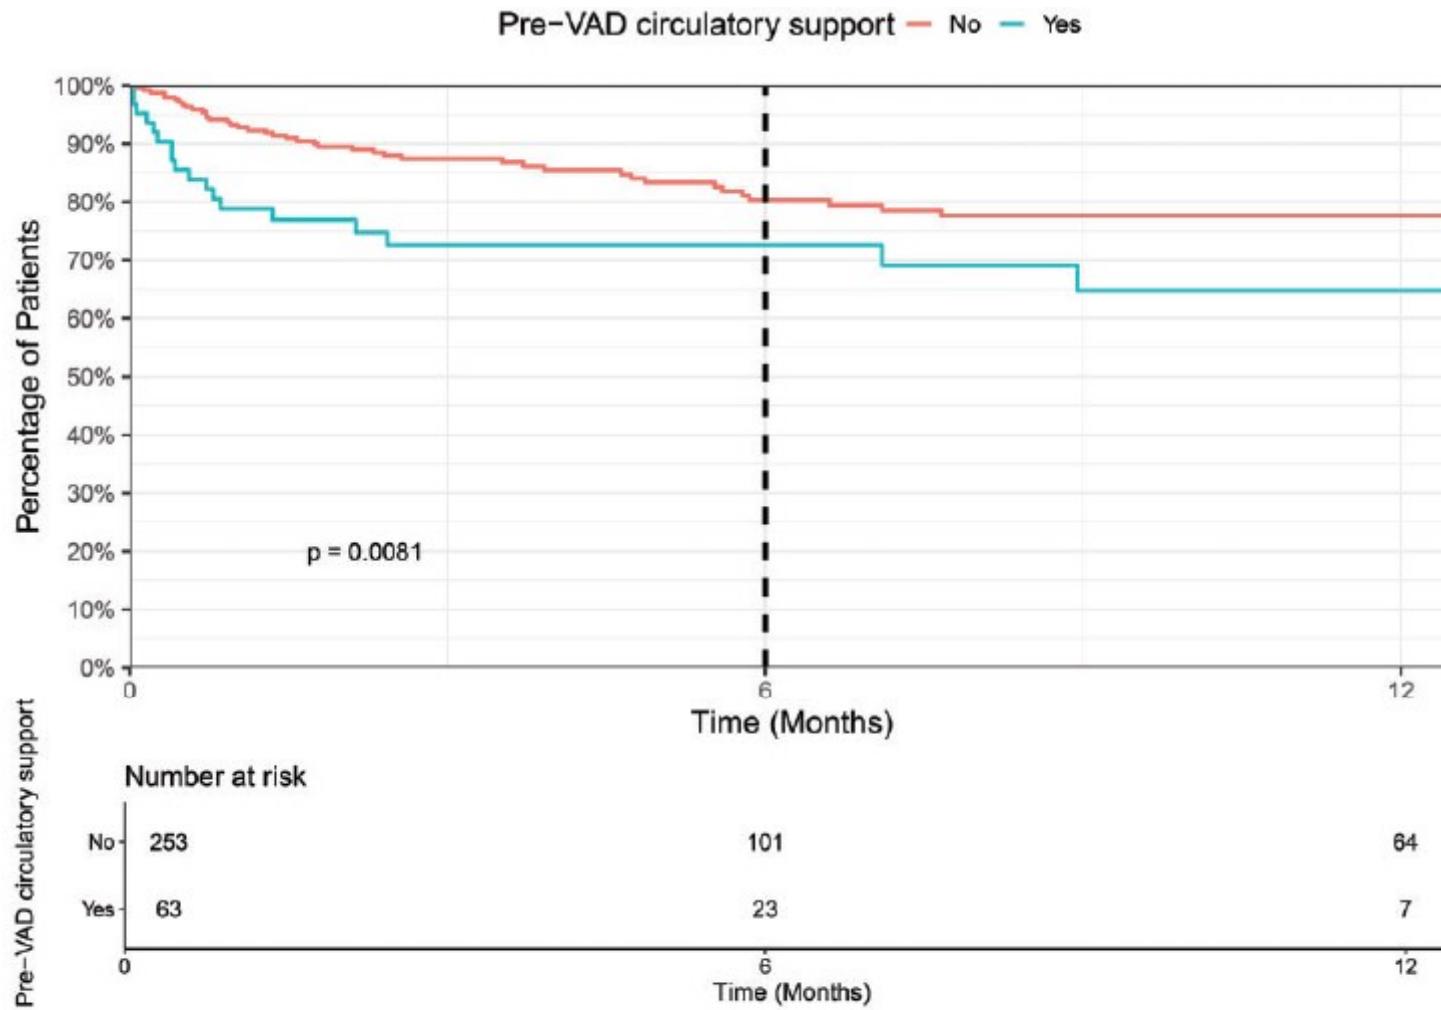

Figure 9: Survival of patients stratified by pre-VAD implant circulatory support VAD: ventricular assist device.

A comparison of survival rates of patients with or without ECLS/IABP with support have a significantly worse outcome ($P = 0.0081$)

Table 9: Univariable and multivariable analyses of baseline predictors for death

Characteristics	Univariable		Multivariable	
	Hazard ratio (95% CI)	P-value	Hazard ratio (95% CI)	P-value
Age (years)				
<1	Reference		Reference	
1–5	0.51 (0.25–1.06)	0.07	0.40 (0.19–0.84)	0.02
6–10	0.39 (0.17–0.89)	0.03	0.48 (0.21–1.09)	0.08
>10	0.28 (0.14–0.55)	<0.001	0.32 (0.16–0.64)	0.001
Device strategy				
Bridge to transplant	Reference		Reference	
Bridge to recovery	1.07 (0.38–2.99)	0.89	1.08 (0.38–3.06)	0.88
Rescue therapy	2.82 (1.38–5.77)	0.004	3.24 (1.56–6.74)	0.002
Device type				
BiVAD	Reference		Reference	
LVAD	0.33 (0.19–0.58)	<0.001	0.37 (0.20–0.68)	0.001

- Older patients and patients supported by an LVAD (compared to BiVAD) lower risk of death
- Patients rescue therapy had a significantly higher risk of death
- Compared to patients <1 year old, the HR for death was statistically significant for patients aged 1–5 years: 0.40 and for patients >10 years: 0.32, trended towards significance for patients aged 6–10 years
- Rescue remained a predictor for a significantly worse survival rate
- The use of an LVAD was associated with a lower probability of death

Table 10: Major adverse events

Major adverse events	Within 3 months		After 3 months		Total
	Event counts	Events per patient-year	Event counts	Events per patient-year	
Device malfunction	106	1.69	107	0.60	213
Major bleeding	30	0.48	7	0.04	37
Major infection	40	0.64	62	0.35	102
Neurological dysfunction	49	0.78	24	0.13	73
Total	225		200		425

- 425 adverse events were reported during VAD support
- < 3 months 225 events 200 > 3 months
- Most frequently device malfunction 106 times < 3 months which resulted in 1.69 events per patient-year
- After 3 months, 0.60 device malfunctions per patient-year were reported
- Event rates for neurological dysfunction and infection were 0.78 ($n = 49$) and 0.64 ($n = 40$) per patient-year, respectively, for the first 3 months.
- After 3 months, 0.13 events of neurological dysfunction ($n = 24$) and 0.35 infections per patient-year ($n = 62$)
- 30 events of major bleeding < 3 months (0.48 events per patient-year) and 7 events after 3 months (0.04 events per patient-year)

- 2nd more details than 1th Paedi-EUROMACS, demographic characteristics =
- Differences PEDIMACS --- 2nd Paedi-EUROMACS: INTERMACS 1 33% vs 21%;
- MV 45% vs 25.3%; ECLS 12.6% vs 17.2%
- PEDIMACS early transplant vs 2nd Paedi-EUROMACS at 6 months (50% vs 35%) at 12m 51.4% vs 46.7%
- 2nd Paedi-EUROMACS > Adverse Events than 1th Paedi-EUROMACS (Sicker ??)
- BiVAD Era 1 23.7% vs Era 2 8.6%
- Class at high risk < 1y in al reports (Europe = North America)
- < 20 kg high risk
- > 10 kg P-VAD = CF-VAD about mortality
- < 1 m² of BSA → mismatch ventricle of BH EXCOR with BSA → > thromboembolic events
- Better mortality in CHD
- Higher mortality in myocarditis
- PEDIMACS registry in North America MANDATORY not in Europe for EUROMACS

Anticoagulation

- Changement du fœtus à l'âge adulte : le concept de *developmental hemostasis*
- Principales changements premières **6-12 mois**, encore jusqu'à **16 ans**
 - Naissance : [protéines coagulations] 50% des adultes
 - Facteurs ↑ progressivement
 - FVII encore plus de temps
 - [Fibrinogène] : naissance VN → ↓ 6–12 mois → 1-5 ans VN
 - ATIII signif ↓ naissance → 3-6 mois, normalisation > 1 ans
 - Protéine C ↓ naissance, VN à 16 ans
 - Protéine S ↓ naissance, VN après 3 mois
 - Plasminogène ↓ naissance, VN > 6 mois
 - t-PA et D-dimeres ↑

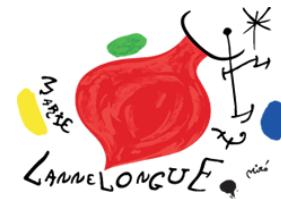

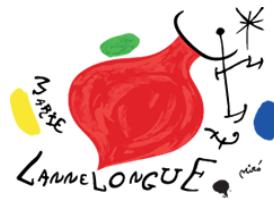

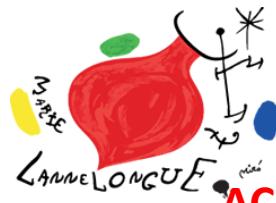

Table 4. Coagulation parameters in neonatal and childhood vs. adult. Summary of test results and potential effect on hemostasis. For details, see Developmental hemostasis part

Component	Parameter	Neonatal period (mean value)*	Normalization	Net effect on hemostasis
Primary hemostasis	Platelets	Normal or increased	1 year (after transient increases)	Enhanced primary hemostasis
	von Willebrand factor	Increased (153%)*	3 months	
	Platelet closure time (PFA-100®)	Shortened	2–4 weeks	
Coagulation	FII, FVII, FIX, FX	Decreased (40–66%)*	1 year (up to 16 year for FVII)	Decreased coagulation potential
	FXI, FXII, PK, HMWK	Decreased (37–54%)*	1 year	
	FV	Normal or decreased (70%)*	1 year (up to 16 year)	
	FVIII	Normal or increased (100%)*	1 month	
	Fibrinogen	Decreased ** or normal	1 year	
	PT	Prolonged or normal	1 year	
	aPTT	Prolonged	1 year (up to 16 year)	
Natural coagulation inhibitors	Antithrombin	Decreased (63%)	3 months	Decreased regulatory/inhibitory potential
	Protein C	Decreased (35%)	16 years	
	Protein S	Decreased (36%)*	3 months	
Fibrinolysis	Plasminogen	Decreased (36%)*	6 months	Increased fibrinolytic activity
	Alpha 2 antiplasmin	Normal or decreased (85%)*	6 months	
	tPA	Increased	1 week	
	D-dimer	Increased	16 years	

Problèmes vs solutions

- Interaction surface sang ↔ éléments externes du circuit → Compatibilité des circuits
- Activation de la chaîne de la Coagulation → Médocs AntiCoagulants (Efficacités, dosage ↔ surdosage, effets collatéraux)
- Activation des plaquettes → Médocs antiagrégants
- Réponse inflammatoire systémique → stéroïdes ?
- Infection → prévention et traitement
- Acquired vWS dans les patients avec VADs

Clopidogrel
Dipyridamole

PDE
Pentossifilline (TAH)

SANG ↔ Materiel → activation hémostase, plaquettes, etc
+ debit non lineare, stress parois → activation PLT

Axial LVAD x100 plus haut stress de parois que arterioles
Jaffer et al J Thromb Haemost 2015

EI associés à l'hémostase

Hémolyse

- Marqueur traumatisme CG pour « shear stress », débit turbulent ou thrombose du VAD
- Temporary VAD, IC axiale, roller pump (ECMO) > IC et EC-VAD avec pompe centrifuge
- Labo : ↓ Hb (TAH 5-7 g/dl → transfusion) ↑ Hb plasmatique (> 40 mg/dL) Ramirez A J Extra Corpor Tachnol 2016
↑ LDH (Signe précoce; si > 1000 UI/ml ou dysfonction pompe → Changer pompe)
- Hb pl ↔ vWF A2 → thrombose pompe du VAD
- Hb pl → ↑ adhésion PLT ↔ vWF A1 ↔ Fibrinogéne → thrombose pompe du VAD

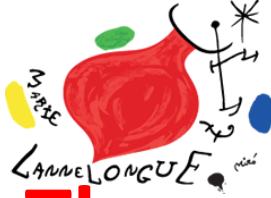

Thrombose

- Canules EXCOR transparents : facile localisation
- Dimensions, position, couleur, mobilité thrombus
- Changement BH-EXCOR pump bedside, canule OR
- Risque AVC ischémique (Evolution hémorragique) ou TE arteriel NON SNC
- IC → thrombose ↔ hémolyse → dx Clinique+ LABO
- Minor hemolysis LDHx2.5 et Hbpl > 20 mg/dL
- Episode HEMOLYSE : Hb pl > 40 symptoms HF ↓Hb et dysfonction pompe

Thrombose

- Fonction pompe : VAD speed- Power spikes
- Jarvick 2015 : dx thrombose = Hb pl + Clinique
- HeartWare : changements pump power-rotor speed-estimated flow → évaluation/diagnostic
- Traitement thrombose : héparine IV (Résolution 23%), Bivaluridine/Argatroban (56%) Thrombolyse (Haut risque hémorragique)
- IC dysfonction (princ thrombose) 16% (x2 que adultes)
- Facteurs ↑ risque thrombose : différences anatomiques (Ventricules petits, VD en position systémique, dextrocardie), causes différentes de HF, différences hémostase P-A

Thrombose

Facteurs ↑ risque thrombose : différences anatomiques (Ventricules petits, VD en position systémique, dextrocardie), causes ≠ insuffisance cardiaque hémostase Péd ≠ Ad

1) Facteurs liés aux patients :

- âge, BMI, SC, sexe
- cardiopathie congénitale type cyanogène
- thrombophilie congénitale ou acquise

2) Facteurs liés au management du patient

- Traitement antiaggrégant (Efficacité)
- positionnement pompe et position des canules (Zones de stasis
→ > risque de formation thrombus)
- Pompe travail à vitesses basses
- HTA non contrôlée

3) Facteurs associés au design de la machine/pompe

Bivalirudin Experience in a Heterogeneous Ventricular Assist Device Population

ANGELA BATES,* HOLGER BUCHHOLZ,† DARREN FREED,† RODERICK MACARTHUR,† TARA PIDBOROCHYNISKI,‡ AND JENNIFER CONWAY‡

- Successful use **BIVALIRUDINE** in Prevention and Management of pump **THROMBOSIS** with 10 HeartWare, 5 HeartMate II, 2 BH Excor
- 14 pts, 17 episodes, 92% M, age 15d-67y median age 45y, 5 pts < 18y
- aPTT - dosage Bivalirudine, LDH Dx thrombose et efficacité
- Adverse Events (Reactions, bleeding, neuro events)
- Efficacy to treat
- Rescue therapy
- Median start after VAD insertion 116d (3-1870d)

Table 1. Patient Characteristics of VAD population on Bivalirudin

Episode No.	Age	Type of VAD	Days Before Bivalirudin*	Days of Bivalirudin	Indication for Bivalirudin	Anticoagulation Before Bivalirudin	Complications on Bivalirudin	Outcome†
1	15 days	Berlin EXCOR	3	113	Suspected HIT	Heparin	None	Death
2	1 year	Berlin EXCOR	35	44	Inadequate heparin levels/pump thrombosis	Heparin	None	Transplant
3	5 years	HeartWare LVAD	21	36	Suspected pump thrombosis	Heparin	None	Transplant
4	7 years	HeartWare LVAD	68	3	Confirmed thrombosis	Heparin	Suspected pump thrombosis	Pump replaced
5	7 years	HeartWare LVAD	170	7	Confirmed thrombosis	Warfarin	None	Transplant
6	10 years	HeartWare LVAD	30	43	Confirmed thrombosis	Heparin	DLI; VAP	Discharge on warfarin
7	10 years	HeartWare LVAD	651	40	Suspected pump thrombosis	Warfarin	DLI; VAP suspected pump thrombosis	Pump replaced
8	20 years	HeartMate II LVAD	92	39	Confirmed thrombosis	Heparin	Minor bleed; GI bleed	Discharge on warfarin
9	43 years	HeartMate II LVAD	92	68	Coagulopathy	Heparin	Major bleed; SDH secondary to fall	Discharge on warfarin
10	43 years	HeartWare LVAD	172	20	Acute kidney injury	Heparin	None	Death
11	47 years	HeartWare LVAD	136	3	Suspected pump thrombosis	Heparin	Minor bleed; GI bleed	Death
12	47 years	HeartWare LVAD	6	9	Suspected pump thrombosis	Warfarin	None	Discharge on warfarin
13	51 years	HeartWare LVAD	156	13	Suspected pump thrombosis	Warfarin	None	Discharge on warfarin
14	51 years	HeartWare LVAD	179	7	Suspected pump thrombosis	Warfarin	None	Discharge on warfarin
15	60 years	HeartMate II LVAD; HeartWare RVAD	3	21	Suspected pump thrombosis	Heparin	None	Death
16	60 years M	HeartMate II LVAD	1,870	7	Suspected pump thrombosis	Warfarin	Minor: BRBPR (hemorrhoids)	Discharge on warfarin
17	67 years M	HeartMate II LVAD	149	48	Suspected pump thrombosis	Warfarin	None	Discharge on warfarin

*These periods refer to days of admission to hospital before bivalirudin was initiated as primary anticoagulation strategy.

†Outcome following discontinuation of bivalirudin infusion; some patients remained on bivalirudin until death, which is indicated in the table.

BRBPR; ; DLI; ; GI; ; HIT; ; LVAD. left ventricular assist device; RVAD. right ventricular assist device; SDH; ; VAD. ventricular assist device; VAP. .

Table 2. Indications for the use of Bivalirudin in Long-Term VADs

Indications for Bivalirudin	No. of Patient Episode(s)
Suspected or confirmed pump thrombosis	13
Suspected HIT	1
Coagulopathy on UFH	1
AKI	1
Inadequate heparin levels	1

AKI, ; HIT, ; UFH, unfractionated heparin; VAD, ventricular assist devices.

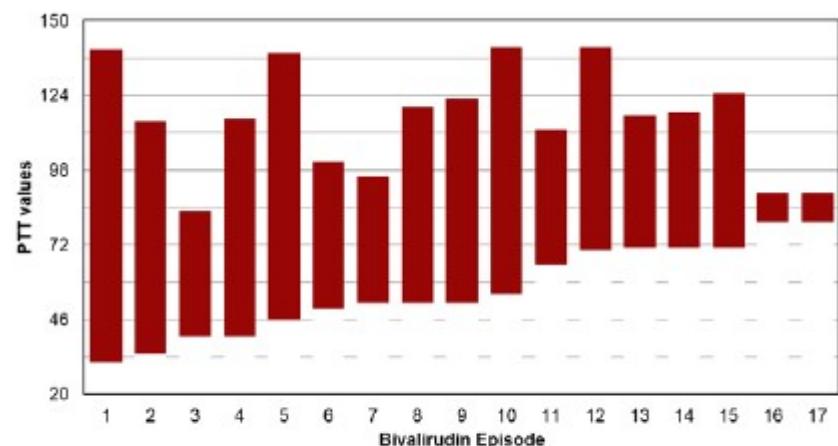

Figure 1. Range of PTT values in patients with long-term VADs during each bivalirudin episode. PTT, partial thromboplastin time; VAD, ventricular assist devices.

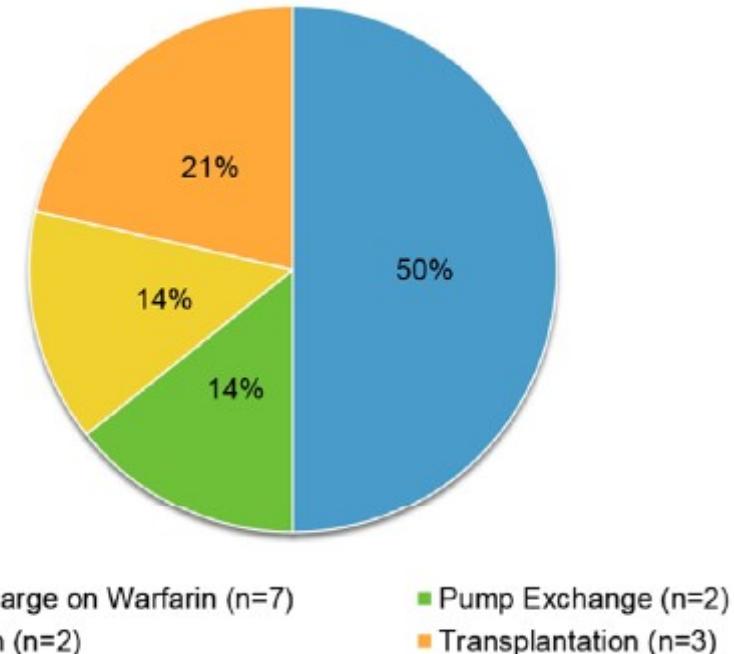

Figure 2. Outcomes following suspected pump thrombosis.

- Early start ($LDH \times 2.5N$) vs Late ($LDH > 3.2 \times N$)
- Bivalent DTI 1) Inhibition circulating and fibrin-bound Thrombin which is reversible) 2) Inhibition Platelet Adhesion
- Less immunogenic than heparine
- Attention: aPTT verify good performed
- Short half-life (30m)
- Less risk of bleeding
- Independent by AT
- Optimal profile in standard use (Thrombosis in first 3 months +++)
- Disadvantages : more fibrin/thrombus in stagnant flow (Off-pump insertion), ECMO pigtail, low-flow state; daily fluctuation
- Early use is better
- Difference pediatric vs adult in pharmacology
- More studies for safety, efficacy

A Review of Bivalirudin for Pediatric and Adult Mechanical Circulatory Support

Tori Taylor¹ · Christopher T. Campbell²  · Brian Kelly³

American Journal of Cardiovascular Drugs

10 November 2020

Table 1 Medication details

	Heparin [31]	Bivalirudin [32]
Mechanism of action	Potentiates the activity of antithrombin III to inactivate thrombin	Reversible direct thrombin inhibitor
Half-life	1.5 h ^a	Normal renal function: 25 min Severe renal impairment: 57 min
Metabolism/elimination	Depolymerization and desulphation via the reticuloendothelial system in the liver and spleen; some renal elimination	Proteolytic cleavage; excreted 20% in urine
Monitoring	aPTT; anti-factor Xa activity; ACT	aPTT; ACT
Complications (noted >10%)	HIT; heparin resistance	Hypotension, pain, headache, back pain
Reversal [33, 34]	Protamine	Factor VII; hemofiltration
Cost per day (\$US) [10]	6	303

Table 3 Review of literature in patients with ventricular assist devices (VAD)

Study	Sample size and population	Study design	Anticoagulant dose and therapeutic targets	Outcomes
Ljajikj et al. [24]	57 adult pts undergoing LVAD implantation on ECLS; 21 pts with HIT received bivalirudin; 36 non-HIT pts received heparin	Retrospective case-control	In pts with ACT <160 s, bivalirudin bolus of 0.5 mg/kg, followed by infusion of 0.5 mg/kg/h. In pts with ACT >160 s, bivalirudin bolus of 0.25 mg/kg, followed by infusion of 0.25 mg/kg/h. Target ACT of 180–220 s	Bivalirudin group had non-significantly higher rate of re-thoracotomy and non-significantly lower rates of delayed chest closure, stroke, intracranial bleeding, 30-day mortality, and 1-year mortality; PS matched analysis revealed no differences in significant outcomes
Pieri et al. [26]	12 adult pts undergoing LVAD placement; 10 pts due to dilated cardiomyopathy, 2 pts due to cardiogenic shock	Retrospective case series	No bivalirudin bolus reported; initial infusion rate 0.025 mg/kg/h; maintenance infusion rate of 0.04 mg/kg/h; target aPTT of 45–60 s	No thromboembolic or major bleeding complications; no VAD-related complications or hemolysis recorded; two episodes of minor bleeding from chest tubes that subsided after reduction or suspension of bivalirudin infusion; RBC transfusions required in 6 pts, FFP transfusion required in 1 pt; no platelet transfusions required; all pts survived to hospital discharge and 1 year; one pt died due to sepsis after 1.5 years of support
Bates et al. [25]	14 long-term VAD pts (9 adults, 5 pediatric) with 17 episodes of bivalirudin therapy; 13 episodes due to suspected or confirmed pump thrombosis, 1 episode due to HIT, 1 episode due to coagulopathy on UFH, 1 episode due to acute kidney injury, and 1 episode due to heparin resistance	Retrospective case series	No bivalirudin bolus reported; initial infusion rate 0.3 mg/kg/h; no maintenance dose reported, target aPTT of 70–90 or 80–100 s	Complications on bivalirudin: suspected pump thrombosis ($n = 2$); VAP ($n = 2$); major bleed, SDH secondary to fall ($n = 1$); GI bleeding ($n = 2$); hemorrhoids ($n = 1$). Outcome following discontinuation of bivalirudin: discharge on warfarin ($n = 8$); death ($n = 4$); transplant ($n = 3$); pump replaced ($n = 2$). No pt deaths directly related to bivalirudin; no reports of reaction to bivalirudin infusion or development of end-organ dysfunction
VanderPluym et al. [28]	43 pediatric pts on DTI for duration of VAD support (39 on bivalirudin), LVAD, $n = 28$; RVAD, $n = 2$; BiVAD, $n = 13$	Retrospective case series	No bivalirudin bolus reported; median initial infusion rate 0.3 mg/kg/h (range 0.1–1.4); median maximum dose 1.0 mg/kg/h (range 0.1–3.9). Target aPTT variable (range 50–100 s)	Major bleeding events occurred in 7 pts with 8 overall bleeding events (6 pts on bivalirudin, 1 on argatroban); all pts were on antiplatelet agent at time of bleeding event. Pump thrombosis event rate of 5.7 per 1000 pt days of support; neurologic event rate of 2.1 per 1000 pt days of support on bivalirudin
Campbell et al. [20]	19 pediatric pts on bivalirudin for VAD (9 pts with BiVAD, 5 pts with LVAD, 5 pts with RVAD)	Retrospective analysis	Initial median (IQR) infusion rate 0.1 (0.1–0.2) mg/kg/h; average infusion rate 0.4 (0.31–1) mg/kg/h; maximum median (IQR) infusion rate of 0.7 (0.41–1.2) mg/kg/h; target aPTT 60–90 s	Average percentage of time spent within goal aPTT range was 67.4%; higher average and maximum dose vs. pts on ECMO; similar initial dose used
Medar et al. [29]	11-month-old girl with dilated cardiomyopathy utilizing LVAD as bridge to transplant (122 days of support)	Case report	No bivalirudin bolus reported; initial infusion rate 0.15 mg/kg/h; maintenance rate ranged from 0.15 to 2.3 mg/kg/h; target aPTT 60–90 s	No evidence of thrombus or need for pump change, no significant bleeding intraoperatively or postoperatively. Pt discharged home on postoperative day 15

Description of Bivalirudin Use for Anticoagulation in Pediatric Patients on Mechanical Circulatory Support

Christopher T. Campbell, PharmD^{1,2} , Lucas Diaz, PharmD¹,
and Brian Kelly, PharmD¹

Annals of Pharmacotherapy 00(0)

Table I. Baseline Demographics.

Characteristic	VAD (n = 19)	ECMO (n = 15)	All (n = 34)
Age (years), median [IQR]	0.16 [0.019-9]	0.33 [0.0027-13]	0.29 [0.015-9.25]
Gender (male), n (%)	8 (42.1)	8 (53.3)	16 (47.1)
Weight (kg), median [IQR]	6.1 [4.4-28.1]	7.4 [3.3-23.7]	6.1 [3.9-24.8]
Height (cm), median [IQR]	67.3 [55.8-116.8]	65.9 [51-147]	66.6 [53.8-123.1]
BSA (m ²), median [IQR]	0.33 [0.26-0.95]	0.37 [0.21-0.98]	0.34 [0.24-0.96]
Primary service, n (%)			
PCICU	19 (100)	13 (86.6)	32 (94.1)
NICU	0 (0)	2 (13.4)	2 (5.9)

Adult and pediatric mechanical circulation: a guide for the hematologist

Lisa Baumann Kreuziger¹ and M. Patricia Massicotte² Hematology 2018

Table 1. MCS options for children and adults

Device	Type of flow	Max pump rate (max flow)	Used in children	Used in adults	Survival	Major hemorrhage	Ischemic stroke
Temporary							
VA-ECMO pumps ⁴	Continuous	(10 L/min)		Yes	Yes	38-68% of ECLS	7-10%*,†
Impella 2.5/CP/5.0 ^{9,10}	Continuous	51 000 rpm (2.5 L/min); 46 000 rpm (4.0 L/min); 33 000 rpm (5.0 L/min)		Yes	Yes	25-46% at 1 mo (adults) 68% at 1 mo (pediatrics)	8% (adults) 5% (pediatrics) 2% (pediatrics)
TandemHeart ⁸	Continuous	3 000-7 000 rpm (5 L/min)		Yes	Yes	43-47% at 1 mo	42-90% 0%
Long-term							
EXCOR ¹⁴	Pulsatile	30-120 bpm (3-7.2 L/min depending on pump size)		Yes	No	Median survival 144-174 d	28%-50%†,‡ 6-29%
HeartMate II ⁶	Continuous, axial	8 000-15 000 rpm (3-10 L/min)	Yes, adolescents	Yes	90% at 6 mo	14-15% at 6 mo	6% at 6 mo
HVAD ¹⁶	Continuous, centrifugal	2 400-3 200 rpm (10 L/min)	Yes, adolescents	Yes	96% at 6 mo	10-14% at 6 mo	7% at 6 mo
HeartMate 3 ⁶	Continuous, centrifugal	3 000-9 000 rpm (10 L/min)	NR	Yes	91% at 6 mo	10-16% at 6 mo	5% at 6 mo
Syncardia TAH ¹²	Pulsatile	125 bpm (7-9 L/min)	Yes, adolescents	Yes	68% to transplant	25% at 1 mo	5% at 1 mo

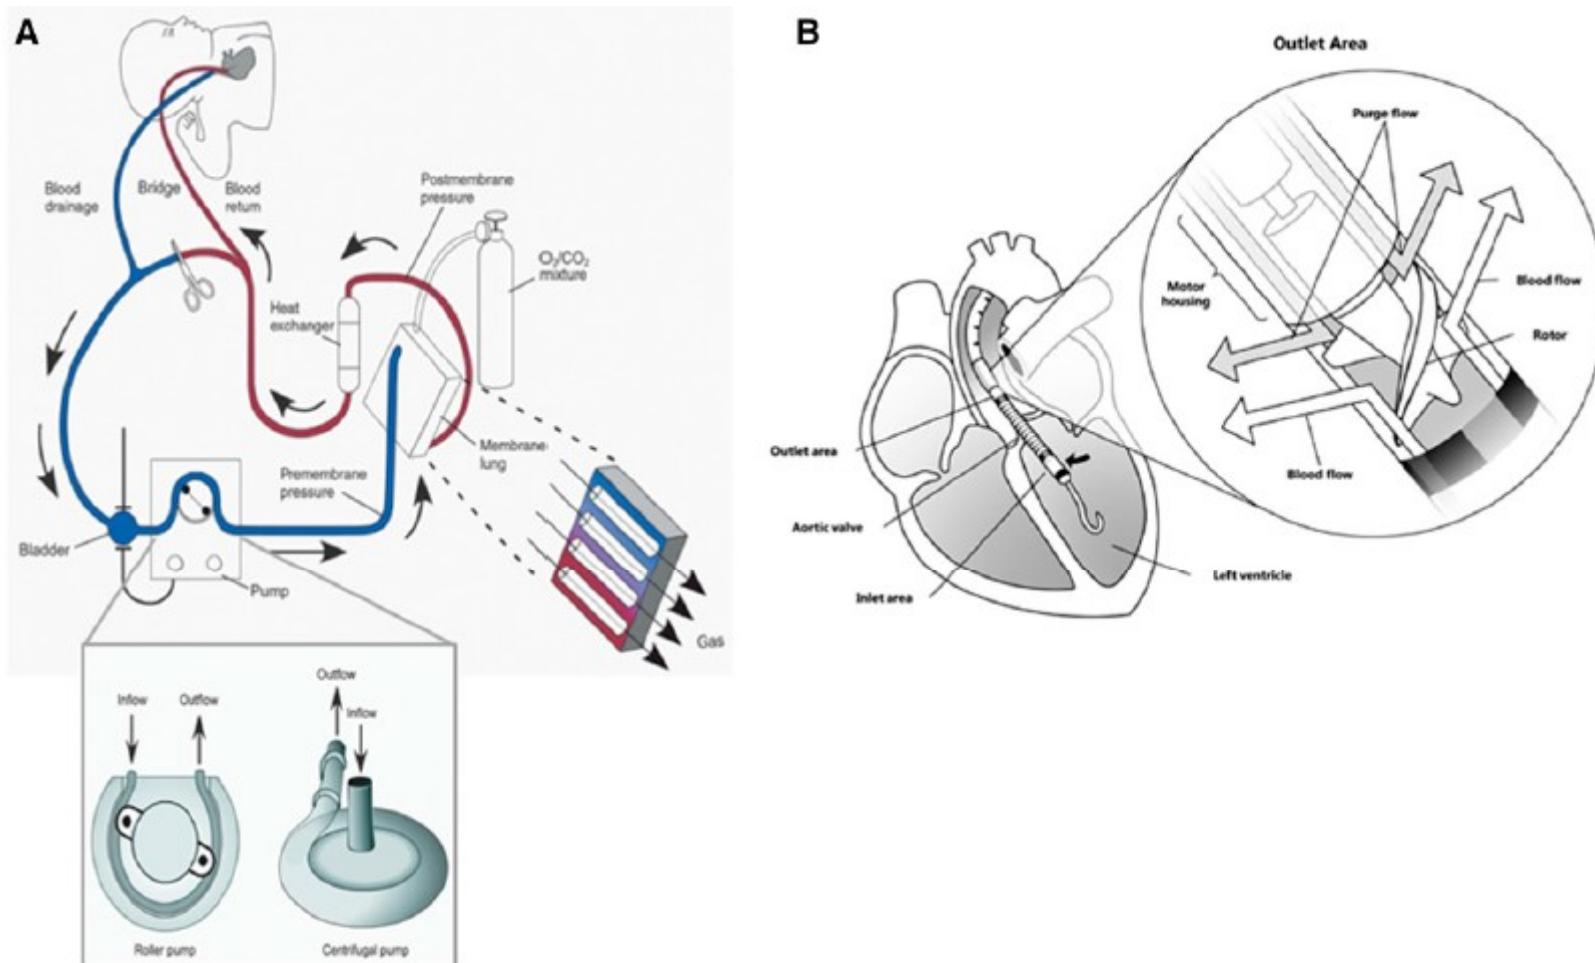

Figure 1. (A) Schematic of ECMO systems using a roller or centrifugal pump. Some centrifugal pumps can be used without the membrane lung as percutaneous VADs. (B) The Impella heart pumps are catheter-based temporary MCS devices. Purge fluid flows retrograde through the catheter in the femoral artery, past the motor housing to cool the rotor, and into the circulation. Originally published in Laliberte and Reed¹¹© [2017], American Society of Health-System Pharmacists, Inc. All rights reserved. Reprinted with permission (R1804).

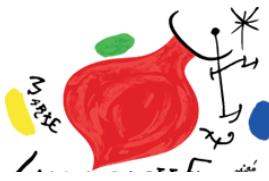

Table 2. Terminology used to describe MCS devices or indications for use

Term	Definition	Device examples
Description of device		
Extracorporeal	Pump for device located outside of the body	ECMO, CPB, EXCOR
Intracorporeal	Pump for device located with the body	HeartMate 3, HVAD
Temporary	Device intended for limited duration of support (hours-days)	Impella 2.5, Impella CP, ECMO
Durable	Device with capability of support for months-years	HeartMate 3, HVAD
Partial support	Device provides less flow than complete cardiac output	Impella 2.5
Full support	Device provides complete cardiac output	ECMO, EXCOR, HeartMate 3, HVAD
Dischargeable	Device does not require hospitalization for continued support	HeartMate 3, HVAD
Type of flow		
Pulsatile	Device with flexible membranes that creates intermittent flow and a pulse	Total artificial heart, EXCOR
Nonpulsatile/continuous flow	Device that provides constant blood flow	HeartMate 3, HVAD
Axial	Device with inlet and outflow in the same axis and flow produced by rotating impeller	HeartMate II, Jarvik 2000
Centrifugal	Device with inlet perpendicular to outflow tracts. Flow produced by centrifugal force.	HeartMate 3, HVAD
Indication for MCS use		
Bridge to transplant	Device implanted to support patient until a heart transplant	HeartMate II, HVAD
Bridge to candidacy	Device implanted to support patient until can determine whether eligible for a heart transplant	HeartMate II, HVAD
Bridge to recovery	Device implanted until myocardial recovery from injury	HeartMate II, HVAD
Destination therapy	Device implanted to support patients who are ineligible for heart transplant	HeartMate II, HVAD
Short term	New term to describe device implanted with intention for months-years of support (replaces bridge to transplant or recovery)	HeartMate 3
Long term	New term to describe device implanted with the intention for years of support (replaces destination therapy)	HeartMate II, HVAD

Table 3. Comparison between Edmonton antithrombotic guidelines and Stanford protocol for management of children with the Berlin Heart EXCOR pediatric VAD

Medication	Edmonton protocol		Stanford protocol	
	Initiation parameters	Goal	Initiation parameters	Goal
Perioperative				
Antithrombin concentrate or plasma	Antithrombin activity < 70%	Antithrombin activity ≥ 70%	Antithrombin activity < 70%	Antithrombin activity ≥ 70%
Protamine	Completion of CPB	Complete heparin reversal (institution-dependent parameters)	Completion of CBP	Complete heparin reversal (institution-dependent parameters)
Postoperative				
UFH	24 h postimplantation, platelets > 20 000/ μ L, normal TEG Platelet Mapping, TEG $MA_{KH} > 46$ mm, TEG $Rc_{KH} < 10$	Anti-factor Xa 0.35-0.5 U/mL, TEG R 8.0-15.0	12-24 h postimplantation, platelets > 40 000/ μ L, no bleeding	Anti-factor Xa 0.35-0.5 U/mL
Antiplatelet				
Dipyridamole	48 h postimplantation, platelets > 40 000/ μ L, TEG $MA_{KH} > 56$ mm, Platelet Mapping: net ADP G ≥ 4, AA inhibition < 70%	Platelet Mapping: net ADP G 4-8, AA inhibition > 70%	8 d after implant, add after max dose of ASA reached and no bleeding	Titrated to a weight-based dose of 15 mg/kg/d
Aspirin	4 d postimplantation, TEG $MA_{KH} > 72$ mm, net ADP G > 2	Platelet Mapping: net ADP G 4-8, AA inhibition > 70%	3 d postimplantation, no bleeding	Titrated to a weight-based dose of 30 mg/kg/d (max dose 2000 mg/d)
Clopidogrel	No recommendation		11 d postimplantation, after max dose of aspirin and dipyridamole reached and no bleeding	Titrated to weight-based dose of 0.2 mg/kg/d, max dose 1 mg/kg/d
Long-term anticoagulant				
Enoxaparin	Age < 1 y, >48 h postimplantation, normal creatinine	Anti-factor Xa 0.6-1.0 U/mL	Age ≤ 2 y, or if unstable INR	Anti-factor Xa 0.6-1.0 U/mL
Warfarin	Age ≥ 1 y, full oral diet	INR 2.7-3.5	Age > 2 y, full oral diet	INR 2.7-3.5
Anti-inflammatory				
Prednisone	No recommendation		As needed for fibrinogen > 600 mg/dL or other signs of inflammation (fever, rise in CRP), no other signs of sepsis	Methylprednisolone should be initiated at a dose of 2 mg/kg/d IV (or PO equivalent) divided BID, discontinue when fibrinogen ≤ 400 mg/dL

Antithrombotic therapies in children on durable Ventricular Assist Devices: A literature review

Joanna Y. Huang^{a,b,c}, Paul Monagle^{b,c,d,*}, M. Patricia Massicotte^e, Christina J. VanderPluym^f

Definition of bleeding and clotting events differed between cohorts. The incidence of bleeding overall was 37% (209/558; range of 0 to 89%) and 26% (143/554; range of 8.3 to 100%) for thromboembolism events. All studies reported had significant methodological limitations.

Conclusions: The clinical use of antithrombotic therapies – including dosages, timing and monitoring – varies considerably. This review highlights the further research required to improve understanding of hemostasis in the pediatric VAD field.

Complications

Adverse Events in Children Implanted with Ventricular Assist Devices in the US: Data from the Pediatric Interagency Registry for Mechanical Circulatory Support (Pedimacs)

Antithrombosis Harmonization Protocol for Pulsatile Paracorporeal VADs (Berlin Heart EXCOR)

action
ADVANCED CARDIAC THERAPIES
IMPROVING OUTCOMES NETWORK

BIVALIRUDIN

1. Pre-VAD implantation work-up (<48 hours pre VAD/MCS):

- Baseline labs: CBC with diff, aPTT*, PT/INR, fibrinogen, basic metabolic panel (BMP)
- Optional labs: TEG with PM, CRP, LDH, cystatin C, HIT screen, ROTEM

2. Intra-op management

- Standard heparin anticoagulation for cardiopulmonary bypass with full protamine reversal in OR
- Standard blood product replacement to normalize coagulation parameters and establish hemostasis in OR

3. Early post-op management

- Labs (aPTT, PT/INR, fibrinogen, BMP, CBC) within 2 hours of arrival to ICU
- Optional: dilute thrombin time (dTT), TEG ± PM, ROTEM
- It appears reasonable to start bivalirudin once:
 - Surgical and coagulopathic bleeding resolved (< 2 ml/kg of chest tube output for 4 hours and no other sources of active bleeding)
 - aPTT within 15 sec of baseline* (or institutional normative range)
 - INR <1.3
 - Fibrinogen > 200
 - Platelet count >100,000
- Correct with blood product replacement as needed, being mindful of risk of dilutional coagulopathy with multiple PRBC transfusions, and correct any surgical bleeding as needed

Standard Goals: In order to learn more about what the ideal level of bivalirudin anticoagulation is, suggested standard goals based on national data have been set as a suggestion. This also helps with clarity for teams at the bedside. Not only are their goal ranges but target PTTs that are central to the range so that patients with a PTT of 61 when the goal is 60-80 will be managed so time within a goal range could possibly be higher.

Antithrombosis Harmonization Protocol for Pulsatile Paracorporeal VADs (Berlin Heart EXCOR)

action
ADVANCED CARDIAC THERAPIES
IMPROVING OUTCOMES NETWORK

- Early Post-op (24-72 hours, high risk for bleeding) target aPTT 55 (goal range 50-60)
- Maintenance (standard risk for bleeding) target aPTT 70 (goal range 60-80)
- Maintenance (High risk for thrombosis) target aPTT 80(goal range 70-90)

TABLE 1: Initial Bivalirudin Dosing

Goal: aPTT	Goal: dilute thrombin time (dTT)
• High risk (of bleeding): aPTT 50-60 sec	• High risk (of bleeding): dTT 50-60 sec
Renal function (GFR)	Initial dosing
Normal (>60ml/min/1.73 m ²)	0.3 mg/kg/hr IV infusion
Mild-moderate (30-60ml/min/1.73 m ²)	0.2 mg/kg/hr IV infusion
Severe (<30ml/min/1.73 m ²)	0.1 mg/kg/hr IV infusion

- Check aPTT 2 hours after first initiation. Cautious about titrating with first level.
 - If aPTT has jumped dramatically to >2-3 x baseline PTT, then decrease Bival by 50% and recheck in 2-3 hours
 - If PTT has increased to 1-1.5 x baseline, make no adjustment and repeat PTT in 2-3 hours as level may continue to rise

Antithrombosis Harmonization Protocol for Pulsatile Paracorporeal VADs (Berlin Heart EXCOR)

action
ADVANCED CARDIAC THERAPIES
IMPROVING OUTCOMES NETWORK

This document is intended to provide recommendations for antithrombosis management of pulsatile paracorporeal VADs (Berlin Heart EXCOR) in children. It was created through the sharing of experience, expertise and data of the ACTION learning collaborative.

TABLE 2: Maintenance Bivalirudin titration

Goal: aPTT	Goal: dTT
Goal: aPTT <ul style="list-style-type: none">• Standard risk: aPTT 60-80 sec• High risk (of thrombosis): aPTT 70-90 sec	Goal: dTT <ul style="list-style-type: none">• Standard risk: dTT 60-80 sec• High risk (of thrombosis): dTT 70-90 sec
If aPTT 5 to 15 sec out of range: <ul style="list-style-type: none">• Increase or decrease by 15% (round up to closest 2nd decimal)• Recheck 2-3 hours after dose change	If dTT 5 to 15 sec out of range: <ul style="list-style-type: none">• Increase or decrease by 15% (round up to closest 2nd decimal)• Recheck 2-3 hours after dose change
If aPTT in target range, no change. <ul style="list-style-type: none">• Recheck 2-3 hrs., then can decrease frequency when stable	If dTT is in target range, no change: <ul style="list-style-type: none">• Recheck 2-3 hrs., then can decrease frequency when stable
If aPTT ≥15-30 sec out of range <ul style="list-style-type: none">• Increase or decrease by 25% (round up to closest 2nd decimal)• Recheck 2-3 hours after dose change	If dTT ≥15-30 sec out of range: <ul style="list-style-type: none">• Increase or decrease by 25% (round up to closest 2nd decimal)• Recheck 2-3 hours after dose change
If aPTT >3x baseline or ~120 sec: <ul style="list-style-type: none">• With <u>normal</u> renal function: hold 15 min and reduce by 30%• With <u>mild to moderate</u> renal dysfunction: hold for 45 min and reduce by 40%• With <u>severe</u> renal dysfunction: hold 2 hours and recheck PTT before restarting	If dTT >100sec: <ul style="list-style-type: none">• With <u>normal</u> renal function: hold 15 min and reduce by 30%• With <u>mild to moderate</u> renal dysfunction: hold for 45 min and reduce by 40%• With <u>severe</u> renal dysfunction: hold 2 hours and recheck PTT before restarting

Antithrombosis Harmonization Protocol for Pulsatile Paracorporeal VADs (Berlin Heart EXCOR)

SIMPLE TITRATION RULE: Adjust your bivalirudin infusion the same % as the difference between the current aPTT and goal aPTT you are trying to achieve

NOTE:

- **aPTT may be impacted with the following:**
 - heparin contamination (from line) (\uparrow aPTT)** (can use concomitant anti-XA (HAL) and/or INR/PT to identify contamination, since INR/PT will NOT increase with heparin contamination alone, BUT will increase with bival concentration)
 - traumatic phlebotomy, high pressure exerted on syringe during sampling (\uparrow aPTT)
 - Stasis draw - either from a sluggish IV for a lab that sat in the lab for too long can be falsely low
 - low fibrinogen, low FXII, VIII (>30-40% depletion) (Example: chylous effusion, excessive PD drainage, liver dysfunction, consumption within clot) (\uparrow aPTT)
 - plateau aPTT: may be seen at high concentrations of bivalirudin (>1mg/L), consider using PT/INR and/or dTT, or DTI specific assay ecarin TT(Hemoclot, HemosIL DTI) [Stago, or STA-R Evolution]
- **dTT may be impacted by the following:**
 - heparin contamination (from line) (\uparrow dTT)** (can use concomitant INR/PT to identify contamination, since INR/PT will NOT increase with heparin contamination alone, BUT will increase with bival concentration)
 - fibrinogen levels
 - NOT impacted by lupus inhibitors or elevated d-dimer
 - Stasis draw - either from a sluggish IV for a lab that sat in the lab for too long can be falsely low

Antithrombosis Harmonization Protocol for Pulsatile Paracorporeal VADs (Berlin Heart EXCOR)

ARGATROBAN

- Partial hepatic metabolism: no need to dose based on renal dysfunction
- If your hepatic function changes, then you should re-check your levels and titrate more cautiously
- Half-life: 39-51 min, may be prolonged further with hepatic dysfunction

The recommended starting dose of Argatroban is 0.5 mcg/kg/min.

- Titration increments are typically 0.2-0.5 mcg/kg/min with final therapeutic doses typically between 1-5 mcg/kg/min.
- Doses as high as 5-8 mcg/kg/min have been used with the recommended maximum in the adult literature of 10 mcg/kg/min.

TABLE 3: Initial Argatroban Dosing:

Goal: aPTT	Goal: dilute thrombin time (dTT)
<ul style="list-style-type: none">• <i>High risk (of bleeding): aPTT 50-60 sec</i>	<ul style="list-style-type: none">• <i>High risk (of bleeding): dTT 50-60 sec</i>
<p>Initial dosing: 0.5 mg/kg/min IV infusion - consider lower dosing if know hepatic dysfunction with baseline elevated INR</p>

action
ADVANCED CARDIAC THERAPIES
IMPROVING OUTCOMES NETWORK

TRANSITION FROM DTI TO VITAMIN K ANTAGONIST (VKA)

- Patients may remain on the DTI for the duration of VAD support, or can be transitioned to enteral VKA at the discretion of the care time
- NOTE: potential for combined effects on INR with co-administration of bivalirudin and warfarin therefore a loading dose of warfarin should NOT be used
- Obtain baseline INR on bivalirudin therapy (NOTE: INR will be prolonged with bivalirudin alone)
- Initiate warfarin at 0.1-0.2 mg/kg/day and obtain daily INR
- Bivalirudin can be discontinued once INR >1.5 above baseline INR (example: if baseline INR 2 on bivalirudin, then discontinue bivalirudin once INR 3.5 on combined bivalirudin and warfarin)
- Target INR for warfarin therapy alone: 3-4
- Bivalirudin should be resumed if INR <3

TRANSITION FROM DTI TO LOW MOLECULAR WEIGHT HEPARIN (Enoxaparin)

- Patients may remain on the DTI for the duration of VAD support, or can be transitioned to subcutaneous LMWH at the discretion of the care time
- Bivalirudin should be discontinued 2 hours after administration of enoxaparin dose and dosed as per institutional recommendations for therapeutic dosing as follows:
 - <37 weeks GA and <3 months: 2 mg/kg/dose sc q 12h
 - ≥ 37 weeks GA and <3 months: 1.7 mg/kg/dose sc q 12 h
 - ≥ 3 months-12 months: 1.5 mg/kg/dose sc q 12 h
 - ≥ 12 months: 1 mg/kg/dose sc q 12 h
- Target LMWH level (anti-Xa level) 0.8-1.2
 - If concern for high risk of thrombosis: target anti-Xa 1-1.5
 - If concern for high than standard risk of bleeding: target anti-Xa 0.5-0.8 OR transition back to bivalirudin for closer titration of anticoagulation goals

Acquired von Willebrand Syndrome in Patients With Ventricular Assist Device

February 2019 | Volume 6 | Article 7

Mechanism

AVWS develops due to Increased shear stress caused by the VAD

→ Loss of the HMW-multimers

→ Reduced VWF collagen binding activity (VWF:CB), ristocetin cofactor activity (VWF:RCo), and VWF:Activity (VWF:Ac)

→ Reduction of the corresponding VWF:CB/VWFAntigen(VWF:CB/VWF:Ag)-ratio, VWF:RCo/VWF-Antigen (VWF:RCo/VWF:Ag)-ratio, and VWF:Act/VWF-Antigen (VWF:Ac/VWF:Ag)-ratios

→ VWF:CB and VWF:RCo-factor, decreased in VAD-patients

- All the CF-VAD patients presented a loss of the VWFHMW-multimers = AVWS

- Heilmann et al. CF-VAD patients developed AVWS within 1 day

- Further investigations, acquired VWF defect within 3 h after VAD-implantation and totally reversed after CF-VAD weaning

CLINICAL IMPLICATIONS OF AVWS IN VAD-PATIENTS: 1) Perioperative bleeding 2) Mucosale bleeding (Princ. GI)

**PATHOPHYSIOLOGY OF BLEEDING RELATED TO AVWS IN VAD-PATIENTS:
arteriovenous malformations (AVM) in gastrointestinal and nasal tracts. Neo-angiogenesis. Angiodysplasia.**

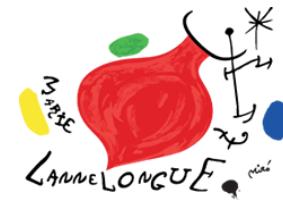

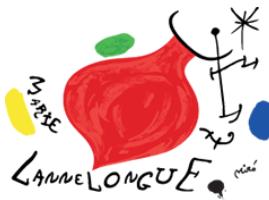

TABLE 1 | Published Literature on the management of GI-bleeding in LVAD patients with antiangiogenic drugs or VWF concentrate.

Authors	Patients treated	Indication	Medication	Outcome	Adverse events
Loyaga-Rendon et al. (70)	7	Secondary prophylaxis of GI-bleeding	Octreotide	No significant reduction in hospitalizations, transfusion need, or number of endoscopies at 3 months	Abdominal pain Diarrhea
Aggarwal et al. (71)	10	Secondary prophylaxis of GI-bleeding	Secondary prophylaxis	No difference in length of hospitalization, GIB recurrence rate, or transfusion need	None reported
Hayes et al. (72)	5	Secondary prophylaxis of GI-bleeding	Octreotide	Successfully treated	None reported
Malhotra et al. (73)	10	Primary prophylaxis of GI-bleeding	Octreotide	No GI-Bleeding events	None reported
Shah et al. (52)	51	Secondary prophylaxis of GI-bleeding	Octreotide	Lower recurrence of GI bleed compared to a matched historical control group (24 vs. 43%; $p = 0.04$)	None reported
Draper et al. (74)	8	Secondary prophylaxis of GI-bleeding	Thalidomide	5 patients had no recurrence of bleeding 2 patients had reduction of bleeding 1 patient died within 1 week of initiation	Neuropathy, Sepsis
Ray et al. (75)	1	Secondary prophylaxis of GI-bleeding	Thalidomide	No recurrent bleeding at 1 year	No thrombosis at 1 year
Seng et al. (76)	11	Secondary prophylaxis of GI-bleeding	Thalidomide	Recurrent GIB occurred in 4 patients (45.4%) post-discontinuation of thalidomide therapy	1 pump thrombosis 1 Neuropathy
Fischer et al. (77)	1	Refractory GI-bleeding	VWF concentrate 80 IU/kg daily	1st GI-bleeding event successfully treated. Restart of VWF therapy with octreotide after recurrence of GI-bleeding	No thrombosis

Surgical Technique for Implantation of the Jarvik-7-100 Total Artificial Heart

William C. DeVries, MD

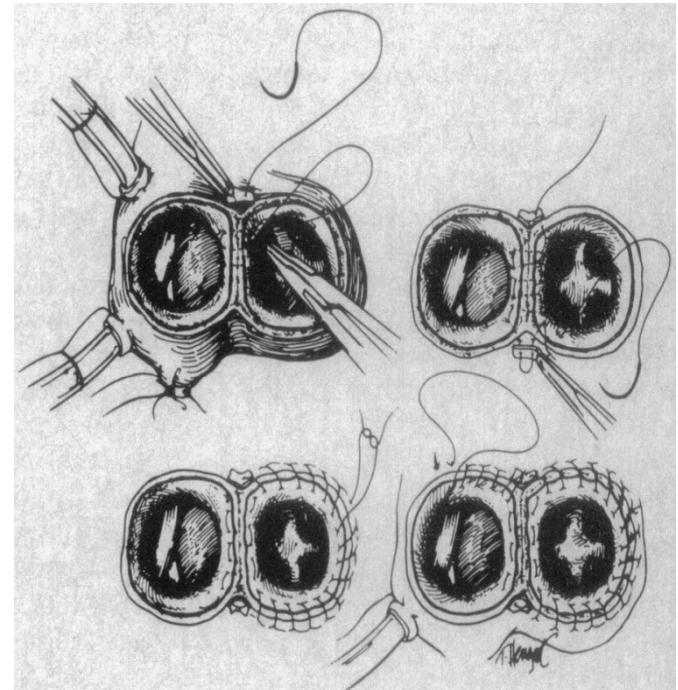

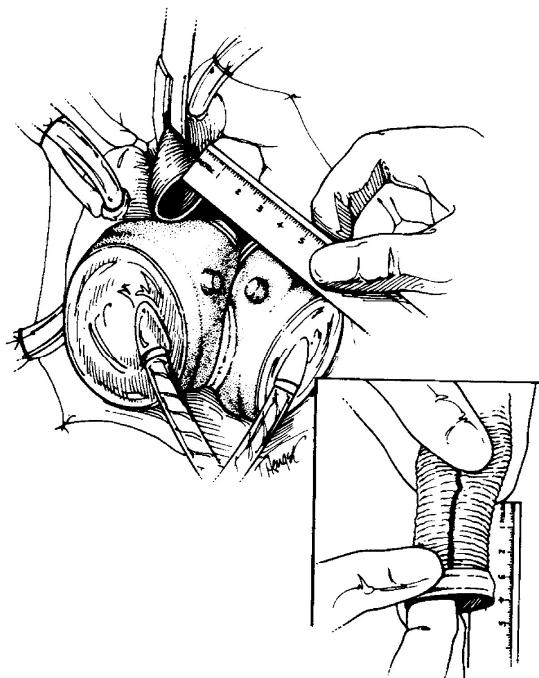

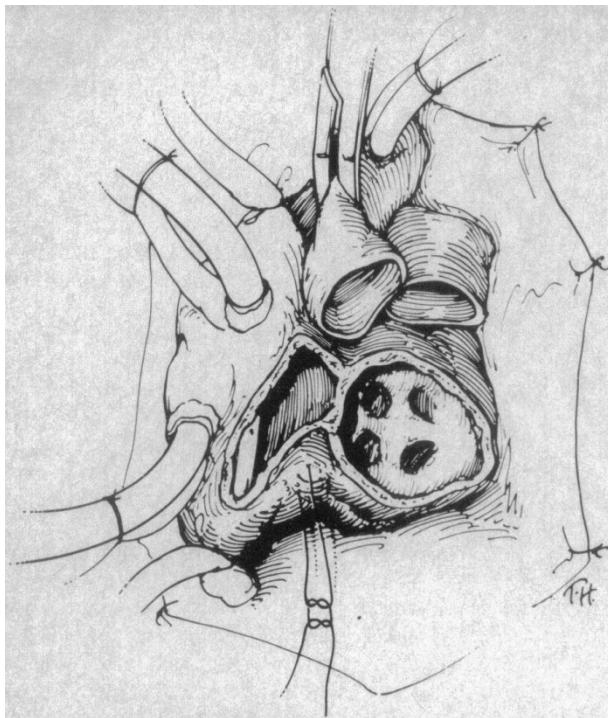

JAMA, Feb 12, 1988—Vol 259, No. 6

The Jarvik-7-100 total artificial heart is a pneumatically powered right and left ventricle replacement device. The device weighs 480 g, measures approximately 10 x 10 x 15 cm, and is made of polyurethane (Fig 1). Blood is pumped by the action of a pulsed air-activated diaphragm with unidirectional blood flow obtained by the use of clinical grade valves (Medtronic-Hall, Medtronic, Inc, Minneapolis) (Fig 1).¹⁰

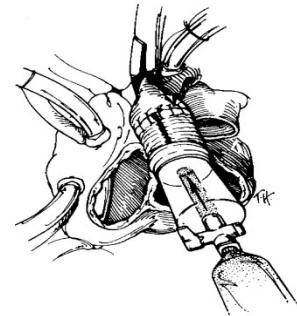

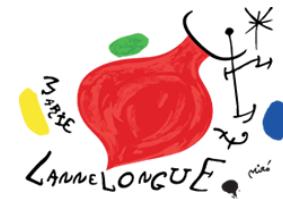

Fig 7.—Hemostasis of each anastomosis is tested by manual injection of blood via adapted syringe fitted to each graft's quick-connect cuff.

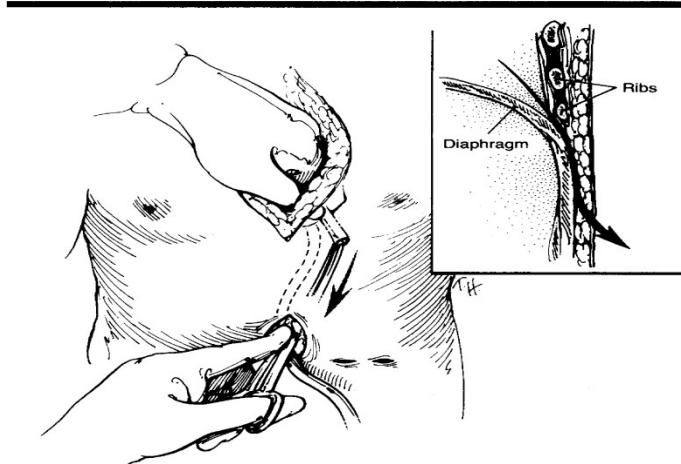

Fig 8.—Before insertion of left ventricle, pneumatic drive line is tunneled from thoracic cavity, through abdominal musculature to ribs, and then through subcutaneous pocket, exiting to skin at midline abdominal incision. Inset, Close-up view.

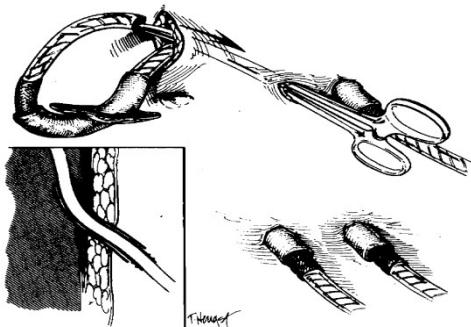

Fig 9.—Skin button is then attached by slipping onto drive lines. Flange is pulled back on itself to form intussusception (inset). End of drive lines will then be brought out through skin with flange of skin button lying flat in subdermal layer.

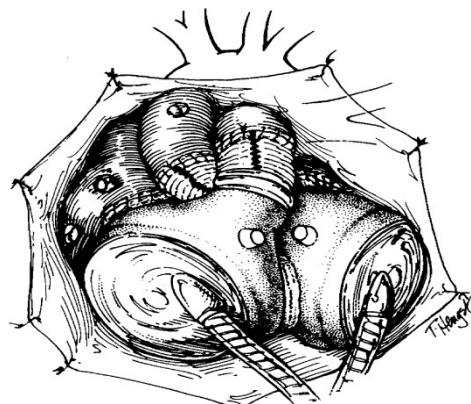

Fig 10.—Using ventricular aspiration ports on blood chambers of ventricles, air is removed from each ventricle before priming with blood and initiation of pumping via Utahdrive System (Symbion, Inc, Salt Lake City).

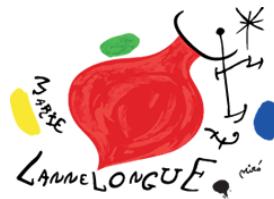

Jarvik

Avantages Continuos Axial Flow VAD

- Pas de « réservoir » de sang (Zone à risque de thrombose et lésions cellulaires)
- Interface sang- VAD réduite
- Pas de valves artificielles (B-H)
- Mouvement unidirectionnel du sang → < risque usure
- < consommation d' énergie (Autonomie batterie B-H Excor max 30 min)
- Poids et dimensions petits
- Pratiquement pas de bruits (Excor !!!)
- < taux infections
- < taux dysfonction pompe

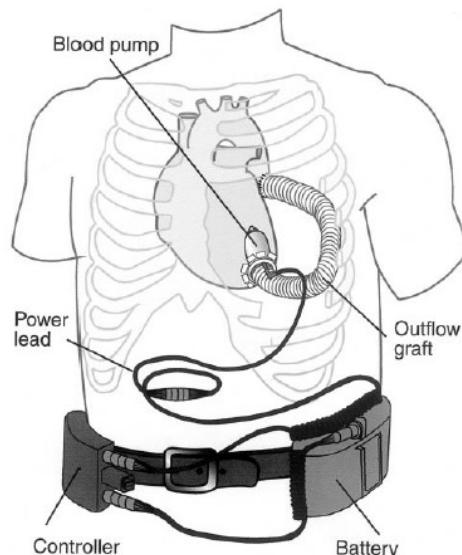

Fig 2. Percutaneous version of the Jarvik 2000. The blood pump is placed within the left ventricle, and the outflow graft is attached to the descending thoracic aorta. The percutaneous lead passes through the abdominal wall and is connected to an external control unit. Power for the implanted pump is received from a battery connected to the controller. (Reprinted from Myers and associates [13] with permission, Isis Medical Media Ltd, Oxford, UK.)

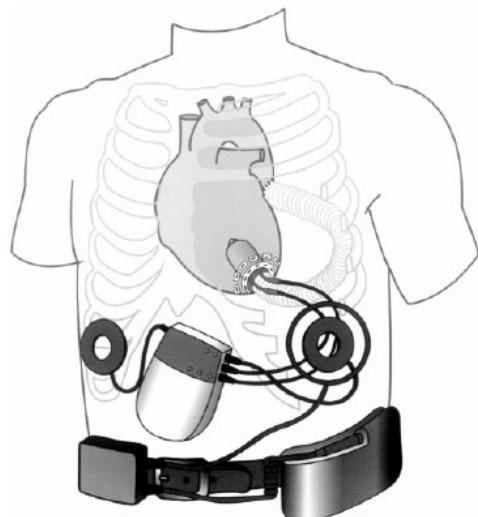

Fig 3. Totally implantable version of the Jarvik 2000. Two power leads exit from the blood pump and are connected to the internal power and control unit. Primary and secondary transcutaneous energy transmission systems coils are placed in different locations in the abdominal wall. The primary transcutaneous energy transmission systems coil provides external power and control, and the secondary transcutaneous energy transmission systems coil allows backup operation. (Reprinted from Myers and associates [13] with permission, Isis Medical Media Ltd, Oxford, UK.)

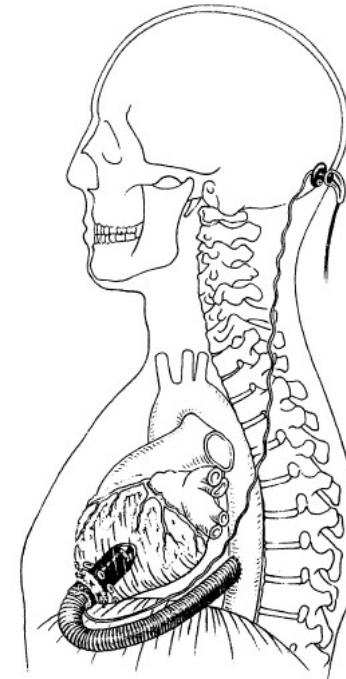

Fig 4. A third version of the Jarvik 2000 system incorporates a titanium pedestal mounted to the posterior portion of the skull. The power and control connection is made just outside the skin. (Reprinted from Westaby and coworkers [15] with permission.)

Jarvik

Advances in technology + increased clinical → development of a new type of blood pump

Jarvik 2000 Heart: electrically powered, axial-flow left ventricular assist device developed in 13 years

Unlike first-generation left ventricular assist devices, 1970s and designed to totally capture the CO, Jarvik 2000 designed **to normalize the CO by augmenting the function of the chronically failed heart for extended periods...**

Interactions tested in 67 animals, and ... Three patients have received the Jarvik 2000 as a bridge to transplantation, and 1 patient is being supported permanently outside the hospital. All 4 patients have improved from NYHA functional class IV to class I, and 2 of them have been discharged from the hospital after HT

The experimental and clinical results indicate that the Jarvik 2000 can provide physiologic support → minimal complications, reliable, biocompatible, easy to implant

PEDIATRIC CARDIAC SURGERY ANNUAL • 2017

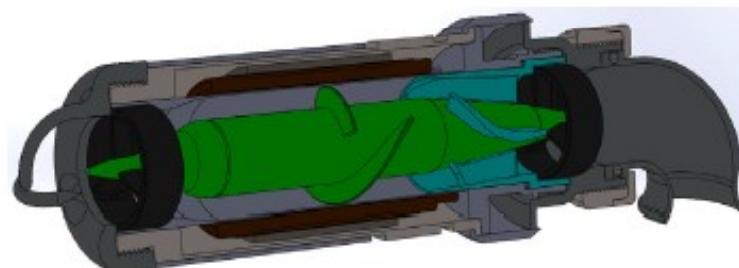

Figure 2 The Jarvik 2015 impeller blades (green) are attached to the rotor (also green). The stator blades (blue), the housing (gray), and cone bearing rings with posts (black) are stationary and only the rotor with the attached impeller blades move. The inflow is to the left, with flow from left to right in the illustration.

The developmental pathway for the Jarvik 2015 has been unique in that the government has taken a lead role and, as a result, it has involved the special productive collaboration and group effort of individuals from the VAD industry, various medical, engineering, and science academic departments and companies, and small business. Through their efforts to develop the device, specifically overcome the hemolysis issue, and plan the clinical study, the Jarvik 2015 is now well-positioned for another IDE submission to the FDA to begin the clinical trial in the near future. This trial, the PumpKIN clinical trial of the Jarvik 2015 VAD, is discussed below.

PumpKIN Clinical Trial

Vitro analyses tests (Texas Heart Institute) → minor modifications to the Infant Jarvik 2000 ↓ hémolysis 1) adding a radius to the impeller tips 2) the impeller speed was kept below 20,000 rpm.
No heating or cavitation.

Running the Infant Jarvik 2000 at 20,000 rpm limit the flow to <0.7 LPM → alternative ↑ diameter pump → lower speeds → flow range appropriate for pediatrics.

Many impeller blade designs ,evaluated using continuous flow devices, for in vitro hemolysis testing. Max level of NIH is 0.10 g/100L initial goal to achieve. Only 1 met the initial NIH goal over the specified pump speed/flow range → Prototype selected as the next version Infant Jarvik VAD

Work completed 2015 + new outer hub diameter of the device was 15mm, new version named the “Infant Jarvik 2015 VAD” → “Jarvik 2015 VAD.”

PumpKIN Clinical Trial

Pump 2 circular-arc impeller blades, a set of stator blades, 2 ceramic cone bearings

No inflow cannula, has an 8 mm outflow cannula, and a Jarvik Heart analogue controller

Jarvik 2015 larger than Jarvik 2000 VAD → ↑ rotor hub diameter

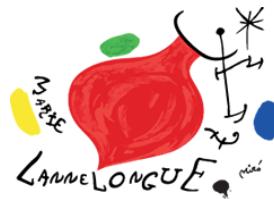

Outer diameter 15 mm Overall length 55 mm (AA battery)

Operating speed range 10,000 to 18,000 rpm, → flow range of 0.5 to 3.0 LPM at DP 45 mmHg

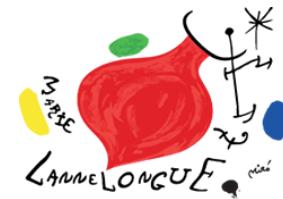

Design improvements (Surgeons)

- 1) an elbow on the outflow of the VAD to reduce the potential for kinking of the outflow graft since the flow must be redirected 180° due to placement of the pump and graft anastomosed to Ao
- 2) 8mm ePTFE outflow graft replaced with an 8mm gelatin-sealed, spiral-supported polyester graft by Vascutek → potential issues related to bleeding (due to needle punctures during suturing) + plasma weeping through the ePTFE grafts
- 3) Sub-diaphragmatic pocket < 8 kgs (Dividing left hemidiaphragm) (CT and MRIs study)

Changes from a parabolic blade arc to a circular one and the Increase in stator blades from three to four.

PumpKIN Trial

Feature	Infant Jarvik 2000 VAD	Jarvik 2015 VAD
		
Rotor Hub Outer Diameter	3.6 mm	5.6 mm
Flowpath Inner Diameter	6.1 mm	8.9 mm
Overall Length	47 mm	55 mm
Housing Outer Diameter	11 mm	15 mm
Rotor Length	37 mm	45 mm
Outflow Direction	0°	90°
Bearing Width	2.5 mm	3.2 mm
Number of Stator Blades	3	4
Number of Impeller Blades	2	2
Blade Shape	Parabolic-arc	Circular-arc
Radiusied Impeller Blades	No	Yes
Speed Range	18,000 to 28,000 rpm	~10,000 to 18,000 rpm
Flow range	~.5 to 1.5 LPM	~0.5 to 3.0 LPM
Graft	8 mm ePTFE	8 mm gelatin-sealed polyester

Descriptive Information

Brief Title <small>ICMJE</small>	Pumps for Kids, Infants, and Neonates
Official Title <small>ICMJE</small>	Pumps for Kids, Infants, and Neonates
Brief Summary	<p>PumpKIN is a multicenter, two prospective, single-arm feasibility studies; One with Standard Cardiac Anatomy and one with Challenging Cardiac Anatomy evaluating the investigational Jarvik 2015 VAD in pediatric patients with heart failure. This feasibility trial will enroll 10 subjects, 5 Standard Cardiac Anatomy subjects reaching endpoints, and 5 Challenging Cardiac Anatomy subjects reaching endpoints at up to 7 sites in the US.</p> <p>The primary objectives of this investigational device exemption (IDE) clinical investigation are to assess the feasibility of using the Jarvik 2015 in pediatric patients with severe heart failure who require mechanical circulatory support. Feasibility will be assessed by evaluating the safety profile of the Jarvik 2015 device in eligible subjects.</p>

PumpKIN Trial

Is the New Infant Jarvik 2015 Suitable for Patients<8 kg? In Vitro Study Using a Hybrid Simulator

Di Molfetta et al. Artif Organs 2019

Because of the difficulties to test a VAD in small animals, the FDA approved the use of the Infant Jarvik 2015 in children higher than 8 kg only (1).

Therefore the aim of this work is to study the feasibility and reliability of the use of the Infant Jarvik 2015 in lower weight patients (<8 kg) using a hybrid model of the human cardiovascular system.

In this specific application, we verified that in the hybrid simulator the Infant Jarvik 2015 could be suitable for implantation in patient weighing less than 8 kg because of the stability of the device in respect to the cardio-circulatory changes in terms of suction and backflow phenomenon and because of the capability of the device in maintaining adequate patient hemodynamics.

PumpKIN Trial

TABLE. Lessons learned from the first implant of Jarvik 2015 LVAD in a 13-kilogram child with DCM.

Problem	Description	Lesson learned/observation
Pre-operative		
Pump fit in pericardial space is uncertain	Prior to pump placement, it is unclear how pump will sit within pericardial space, or whether creation of a diaphragmatic pocket would be preferable.	Pre-operative CT of chest facilitates fit assessment and surgical planning. No diaphragmatic pocket was required to place the pump, but no barriers to creating a pump pocket were identified by the surgical team.
Operative		
Ringed outflow graft is too stiff, and sutures holes tend to bleed	Stiff outflow graft is difficult to manipulate. Suturing the outflow graft directly to the aorta created too much tension on the aorta, with risk of obstruction and bleeding	Anastomosing the outflow graft to a Dacron chimney graft created less tension on the aorta and led to less bleeding. Also, allowing outflow graft to cross below the RV and curve up the right side of the mediastinum reduced the risk of graft damage on reopening the chest at transplant. The problem of the stiff outflow graft can also be alleviated by peeling back the radial graft support.
Prior ventriculostomy site from the EXCOR inflow cannula	Large ventriculostomy site from prior placement of the 9 mm EXCOR cannula complicated surgical placement of the Jarvik	Prior EXCOR cannula site can be used (with using the coring needle) allowing pump placement to be aligned (parallel) to the septum
Lack of a flow sensor	To keep the device small, no flow meter exists (similar to the adult Jarvik device).	Pump flow is estimated from the HQ curve (Figure 1B). Recommend posting the HQ curve at the bedside for quick reference. An LA line may be helpful for precise estimation of the pressure change across the device. However, the CVP is a useful surrogate if RV dysfunction is minimal, or well-compensated (low RAP) with medical support.
Post-operative		
The driveline cable is too short	Inadequate cable length to loop the cable in the abdomen to relieve stress in the event the driveline was pulled accidentally	Recommendation to Jarvik, Inc to increase the driveline cable length from its current size (21 cm) to the adult standard (30.5 cm) (recommendation approved by FDA and executed).
Driveline cable is	Driveline cable is too flexible	Recommendation to add a bend-relief device to the driveline

too flexible which could injure the wires causing a fault	at the point where the velour terminates, creating a potential fault point related to bend injury.	to prevent wear on the driveline cable (recommendation approved by FDA and executed).
The power meter is calibrated up to 6 watts only, rather than 11 watts like the adult Jarvik.	Because the power meter is not calibrated beyond 6 watts, it is difficult to know how close the pump is to 11 watts, where the automatic pump stoppage (to avoid overheating) is triggered.	Increase the calibration range of the power meter from 2 to 6 to 1 to 11 (recommendation approved by FDA and executed)
Risk of pump thrombus	Despite axial-flow design, the miniaturized pump is still prone to thrombus	Key strategies to avoid pump thrombus: (1) early surgical hemostasis is critical to initiate antithrombotic therapy in a timely fashion; (2) bivalirudin appears to provide better protection than heparin (now approved by FDA as the primary anticoagulant for PumpKIN Trial); (3) interruptions to anticoagulation should be avoided; (4) conversion to conventional anticoagulants like warfarin or enoxaparin should be done cautiously, and higher target goals and higher doses of antiplatelet therapy may be needed in smaller subjects (e.g. <10 kg); (5) hypertension must be controlled meticulously because of the risk of lower flows, or even reversal of flow, that can precipitate pump or outflow graft thrombus. Blood pressure guidelines from the Advanced Cardiac Therapies Improving Outcomes Network (Action) may be useful BP targets to follow.
Risk of hemolysis	Because of its smaller size, some degree of hemolysis may occur more frequently with the Jarvik pump	Low grade hemolysis may be more common with the Jarvik pump. Lowering the RPM may be helpful provided pump flows are adequate at a given blood pressure. If transfusion is required, avoid older (>2 weeks) packed red blood cells which tend to be more fragile and susceptible to lysis with sheer stress.

PumpKIN Trial

- Thoratec Centrimag / Pedimag - Maquet RotaFlow, canules CEC / Berlin Heart
- 2005-2014, rétrospective, single center (Edmonton), 27 pts, 33 runs, 1 run= 1 event
- Primary outcome : decanulation (Greffé, recovery, long-term VAD, death)
- Complications : saignement (reprise pour hémorragie / hematome), neuro (AVC), infections (Germe isolé), ischémie d'organes (G-i, rate, foie, etc), device malfunction (Pièce/device à changer pour causes techniques autre de la thrombose)
- Statistique descriptive
- Gestion du malade : previous ECMO (Type, timing), CRRT, ajoute oxygénateur, anticoagulation (Timing start, cible anti-Xa, drains)

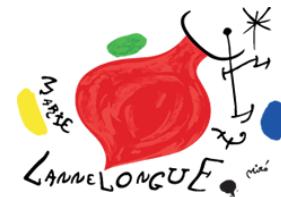

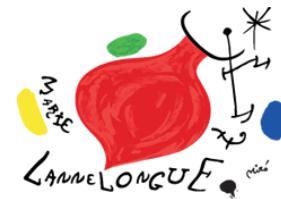

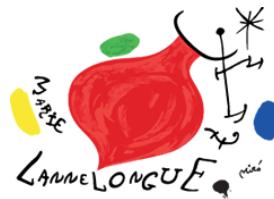

Table 1 Demographic and Clinical Characteristics of Patients With Short-Term Continuous-Flow Ventricular Assist Device Implant Based on Implantation Strategy

Variables ^a	All patients	Site of implantation of VAD		
		Left and systemic ventricle	Right ventricle	Biventricle
Patients	27	15 (56)	5 (19)	7 (26)
Total STCF-VAD runs	33	18	8	7
Age at implant, years	1.7 (0.1, 4.1)	0.7 (0.1, 3.6)	1.4 (0.2, 10.8)	3.5 (0.6, 16.5)
Weight at implant, kg	8.9 (3.7, 18.0)	7.2 (3.6, 14.8)	10.9 (3.8, 29.5)	14 (8.4, 41.0)
Female sex	15 (56)	9 (60)	2 (40)	4 (57)
VAD implantations, No.				
1	23 (85)	13 (86)	4 (66)	6 (100)
2	2 (7)	1 (7)	1 (17)	
3	2 (7)	1 (7)	1 (17)	-
Duration of support per run, days	12 (6, 23)	11.5 (7, 37)	12.5 (2, 28)	12 (9, 22)
Diagnosis at implantation	33			
Cardiomyopathy/myocarditis	11 (33)	5 (28)	3 (43)	3 (38)
Congenital heart disease ^b	14 (42)	10 (56)	2 (29)	2 (25)
Post-transplantation	6 (18)	2 (11)	1 (14)	3 (38)
Other	2 (6)	1 (6)	1 (14)	
Pre-implant ECMO	15 (45)	8 (44)	2 (25)	5 (71)
Oxygenator added to the circuit	20 (61)	9 (50)	5 (63)	6 (86)
Renal replacement therapy	21 (64)	11 (61)	4 (50)	6 (86)

ECMO, extracorporeal membrane oxygenator; STCF, short-term continuous-flow; VAD, ventricular assist device.

^aContinuous data are presented as the median and interquartile range (25th quartile, 75th quartile) and categoric data as number (%).

^bCongenital heart lesions (13 patients/14 runs): transposition of great arteries ($n = 3$), anomalous left coronary artery from the pulmonary artery ($n = 2$), Ebstein anomaly ($n = 2$), Shone complex ($n = 1$), bicuspid valve ($n = 1$), biventricular outflow tract obstruction ($n = 1$), Fontan ($n = 2$), and right atrial isomerism with unbalanced atrioventricular septal defect ($n = 1$).

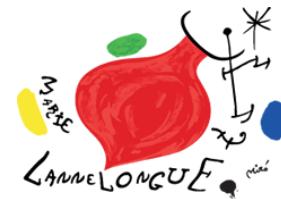

Short-term continuous-flow devices

Table 2 Number of Runs and Duration of Support by Type of Device

Type of device	Runs (N = 33) No. (%)	Duration of support	
		Median (IQR) days	Min–Max days
CentriMag/PediMag	19 (58)	11 (6, 33)	2–75
RotaFlow	8 (24)	9 (3, 19.5)	1–37
CentriMag/PediMag and RotaFlow	6 (18)	20 (12, 33)	9–70

IQR, interquartile range (25th, 75th quartile).

Bien dépassée la limite de 14 jours (définition short-term device)

Short-term continuous-flow devices

Table 3 Cause of Death During Hospital Admission for Short-Term Continuous-Flow Ventricular Assist Device Run

Patient	Diagnosis	Duration of ST-CF VAD support (days)	Death on device ^a	Cause of death	Comments
1	HTx and RV failure	75 days pre-HTx; 6 days post-HTx	Yes	MOD post-HTx	CentriMag pre-HTx for myocarditis and post-HTx for RV failure
2	Allograft vasculopathy	37	No	Ischemic bowel	Converted to ECMO for sepsis before death
3	Primary HTx and BiV failure	6	No	MOD post-second HTx	On ST-CF VAD till re-HTx, died after 2 nd HTx after support withdrawn
4	RAI, AVSD PS and BiV dysfunction	68	Yes	Heart failure	One-way wean due to MOD
5	Post-Fontan operation	2 runs: 10 days and 45 days	Yes	MOD	Native heart excised due to intramyocardial hematoma
6	Transposition of the great arteries	7	Yes	Renal failure, with severe uncontrollable fluid overload	Therapy withdrawn
7	BiV outflow tract obstruction with LV dysfunction	4	No	Died post-HTx from MOD	Was converted to ECMO pre-HTx and received HTx from ECMO
8	Bicuspid aortic valve and endocarditis	22	Yes	MOD	
9	Neonatal Ebstein anomaly	2	No	Sepsis with MOD	Converted to ECMO before death

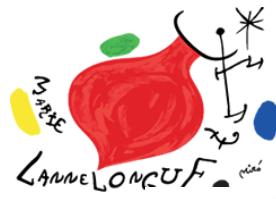

AVSD, atrioventricular septal defect; BiV, biventricular; ECMO, extracorporeal membrane oxygenation; HTx, heart transplant; MOD, multiorgan dysfunction; PS, pulmonary stenosis; RAI, right atrial isomerism; RV, right ventricle; ST-CF, short-term continuous-flow; VAD, ventricular assist device.

^aDeath on device or within 1 month of weaning.

John C. Dykes, MD, Beth D. Kaufman, MD, Chris S. Almond, MD, Olaf Reinhartz, MD,
Jenna Murray, NP, and Sharon Chen, MD

Department of Cardiothoracic Surgery, Stanford University, Palo Alto, California; Department of Pediatrics, Stanford University, Palo Alto, California; and Division of Department of Anesthesiology, Stanford University, Palo Alto, California

- Retrospective review describes an institutional experience with VAD support for patients with BDG from April 2011 to January 2019
- A total of 7 patients with BDG (weights, 5.6 to 28.8 kg; ages, 7 months to 11 years) underwent VAD implantation.
- 3 patients underwent implantation of Berlin Heart EXCOR, 2 had HeartWare HVADs and 2 patients underwent implantation of paracorporeal continuous flow devices
- 2 alive et 5 death

- The surgical strategy and postoperative management of VAD with BDG are still evolving
- Successful support can be achieved with:
 - (1) both pulsatile and continuous flow pumps
 - (2) atrial or ventricular cannulation
 - (3) with or without BDG take-down
- Surgical strategy should be determined by individual patient anatomy, physiology, and condition
- OUTCOME ?????

with ventricular dysfunction*

MCS in ACHD

Transplant and mechanical circulatory support in patients with adult congenital heart disease

James Monaco¹, Amber Khanna¹, Prateeti Khazanie¹ *Heart Fail Rev.* 2020 July ; 25(4): 671–683.

- All aspects of GUCH in advanced HF about Transplantation and MCS
- Continued improvement in MCS utilization to improve waitlist outcomes for GUCH
- Mechanical support of the systemic right ventricle with a subpulmonic left ventricle and MCS in Fontan population
- Mechanical circulatory support in ACHD more robust outcomes data become available to support its benefit → Durable VADs increasingly popular option both for optimizing patients listed for transplant or possible destination therapy
- Outcomes in ACHD MCS are likely to improve as perioperative experience increases and as patient selection trends toward less critically ill patients

Considerations for Advanced Heart Failure Consultation in Fontan Patients:

Guidance for primary cardiologists

action
ADVANCED CARDIAC THERAPIES
IMPROVING OUTCOMES NETWORK

HARMONIZED PROTOCOL

BACKGROUND

To aid in decision-making on timing of referral of Fontan patients for advanced heart failure consultation with the aim of improving timely referral and facilitating collaborative care to enhance patient outcomes.

Patient population: Fontan patients

Considerations for referral by type of clinical Fontan dysfunction (recognizing overlap exists between categories)

Cardiac/Systemic Ventricular Dysfunction

- 1) Severe¹ systolic dysfunction by echocardiogram, MRI, or cardiac catheterization.
- 2) Moderately depressed (by qualitative assessment) systolic function on imaging when accompanied by ≥moderate systemic AV valve regurgitation.
- 3) Significant growth derangement or failure to thrive including cachexia or linear growth failure
- 4) Decreasing exercise tolerance by patient report or as measured on sequential formal exercise testing or 6-minute walk
- 5) Significant electrophysiologic abnormalities, including recurrent arrhythmias despite therapy, implantation of a cardiac pacemaker, or aborted sudden cardiac death event

Fontan Pathway Dysfunction

- 1) Symptomatic, chronic fluid overload persisting despite new or increasing diuretic therapy
- 2) Occurrence of chronic pleural effusions or ascites, chylous or nonchylous, refractory to therapy and occurring outside the initial Fontan post-operative period
- 3) Major hemodynamic disturbance *resulting in symptoms* despite therapy including: low systemic cardiac output, diastolic ventricular failure, significantly elevated Fontan pressure, or symptomatic cyanosis

Lymphatic Dysfunction

- 1) Protein-losing enteropathy that has failed medical therapy and requires multiple hospital admissions in a 12-month period or PLE requiring repeated albumin infusions to treat symptoms despite standard PLE medical therapy
- 2) Plastic bronchitis requiring chronic therapy

Extra-cardiac Dysfunction

- 1) Hemoptysis requiring evaluation that is unrelated to an infection and persists after standard intervention
- 2) Liver disease with impaired synthetic function/abnormal liver function testing or undergoing evaluation for liver transplantation
- 3) Chronic kidney disease – Stage 3 or greater²

Quality of Life

The Ventricular Assist Device in the Life of the Child: A Phenomenological Pediatric Study

Michael A. van Manen

Qualitative Health Research
2017, Vol. 27(6) 792–804

Without a doubt, there are significant emotional and psychosocial burdens of living with a VAD. Caregivers need to support children whether it means making sense of the life situation, dealing with the worries of medical complication, or simply living with the sensations of the mechanicity of the device. Just like in other medical contexts, we need to consider how children can habituate to the VAD so they can focus on the ordinary and routine aspects of their lives even in the context of dependency and uncertainty (Stewart, 2003). Recognizing the VAD may also

Parental responsibility for pediatric ventricular assist devices: Views of families on the acceptability of hospital discharge

Lisa Crowe¹ | Emma Simpson² | Zdenka Reinhardt² | Judith Rankin¹

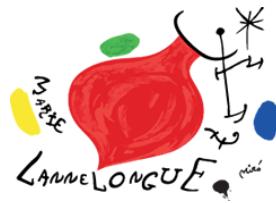

- Teams efforts to provide each family with private time alone, if at all possible
- Mobile paracorporeal technology is expected to improve the freedom /quality of life, but discharge home not expected until proven safety and benefit
- Families struggle with the emotional and practical challenges of the bridging period and experiences of helpful interventions need to be shared between hospital teams
- In this single-center study, families showed a lack of understanding for the complexities of transplant listing status and criteria in general, with a tendency to oversimplification
- Transplant teams should ensure that a change in listing status does not become a barrier to discharge home, if this is desired and felt to benefit the child
- Goal setting and discharge planning should deal with the specific concerns of families and should be individualized and achievable
- Development of a discharge program, co-designed with all relevant parties. Working with families around discharge will ensure their views and concerns
